6502 USER NOTES

no. 16 — $2.50

EDITORIAL

6502 FORTH is ready for distribution! I also have seven articles on 6502 FORTH enhancements for future issues. One of the articles even describes how to add machine language monitor-like functions to 6502 FORTH! That really drove home the point to me that FORTH is a complete programming system!

Issues 1-6 of the User Notes have been completely re-typed and are now going in to layout. The typing took longer than we expected so I can't announce back issues as being ready yet. If you would like immediate notification of back issue availability (issues 1-6) please send us a self addressed stamped envelope. As soon as we are ready to take orders, we will let you know the price. Your patience is appreciated.

I don't believe price alone should be the determining factor in purchasing computers software and equipment. This seems to be the case, though, with most of the hobbyists I have spoken with. Consumer education seems to be the way to turn this around.

In an upcoming issue, I plan to present comparison charts for all the 6502 assemblers which are available and another one for the 6502 disk systems.

Hopefully, this will give us all an overall picture of what we're really getting for our bucks.

-Whats Happening

ROCKWELL has recently added several AIM-65 application notes to their already substantial array of system documentation.

No. R6500 N08	RS-232C INTERFACE FOR AIM-65
R6500 N09	INTERFACING R6500 MICROPROCESSOR TO A FLOPPY DISK CONTROLLER.
R6500 N11	INTERFACING KIM-4 TO AIM-65
R6500 N12	A CRT MONITOR OR TV INTERFACE FOR AIM-65

(The last one is particularly interesting as it presents a complete hardware and software design for a 16 chip 40x16 video interface using the Motorola (and shortly Synertek's) 6845 CRT controller chip. This design looks to be useable on ANY 6502 based system with a 1 MHz clock. Parts costs should be around $100).

These application notes are available at no charge from:

ROCKWELL MICROELECTRONIC DEVICES

ANAHEIM, CA 92803

6502 USER NOTES is published bimonthly by Eric C. Rehnke (POB 33093, N. Royalton, Ohio 44133 (216-237-0755). Subscription rates for Volume 3 are $13.00 (US and Canada) and $19.00 elsewhere. One subscription includes all 6 issues of a volume and cannot carry over part way into the next volume. If less than a full volume is desired, remit $2.50 for each issue wanted.

Rockwell also announced their AIM-65 Expansion Motherboard. This 5-slot backplane is bus compatible with the SYSTEM/65 as well as the Motorola Exorciser. Its priced at $195. For a complete product description which includes a complete schematic, ask for document number 29650 N57.

SYNERTEK has dropped the retail price of the SYM to $239!

They've also introduced several new chips which should help to bolster the 65XX family image. One of these chips, the 6551 ACIA, is mentioned in the 65XX FAMILY CHIP STUFF section elsewhere in this newsletter. The other new chips, the 6545 CRT controller and the floppy disc controller are not into production yet and will be mentioned more when they are real.

HDE has been shipping their mini-floppy systems and their cassette based assembler/editor package.

A number of firms, including HDE, have been caught in the industry wide LS (low power Schotky) component shortage which has been playing OEM's for most of the summer.

Before ordering anything that might contain LS components, it might be worth a phone call or a letter to the supplier to see what the situation is. This shouldn't be regarded as a blanket excuse for slow delivery times from suppliers but could be a possible explanation.

An outfit called Perry Peripherals is adapting the HDE mini floppy system to the S-100/KIMSI system. Should have more info by next issue.

We now have a European distributor! European stores can contact:

POSTFACH 437
WEST GERMANY

An aquaintance of mine and a fellow ex-MOS Technology employee, Ray Bennett, President of RNB Enterprises, called me the other day with some disturbing news. Ray indicated that he noticed a very substantial decrease in his mail order business when the news of the World Power Systems fraud became known.

It's the old story of a few unsavory types messing things up for the rest.

LOCAL 6502 ORIENTED USER GROUPS

LICA (Long Island Computer Assoc.)
#6 Brookhaven Dr.
Rocky Point, NY 11778

SAN FERNANDO VALLEY 6502 USERS CLUB meet at 8:00 PM on the 2nd Tuesday of each month at Computer Components of Burbank, 3808 West Verdugo Ave, Burbank CA 91505. Contact Larry Goga (3816 Albright Ave, Los Angeles, CA 90066, 213-398-6086), for more info. This group also publishes a monthly newsletter which is available for $2.00 a year. Useful stuff!

WAKE--Washington Area KIM Enthusiasts--meet each month at the McGraw-Hill Continuing Education Center in Washington, D.C. to study operation, expansion, and applications of KIM 1 microcomputers. Meetings are at 7:30 on the third Wednesday of every month.

For a copy of the current WAKE newsletter, send a stamped, self-addressed envelope to WAKE, c/o Ted Beach, 5112 Williamsburg Blvd., Arlington, VA 22207, or phone (703) 538-2303.

FOUR PART HARMONY (cheap!!)

KIM-1 MUSIC PROGRAM

by Richard Martin

(A) ABSTRACT

The KIM-1 music program "plays" music in four part harmony on an unexpanded KIM-1 micro-computer.

(B) EQUIPMENT REQUIRED:

KIM-1 module with power supply, four (4) 150K ohm resistors, a 2.2 uF capacitor, an audio amplifier, and speaker. Refer to Figure 1 for hardware connection.

(C) OPERATION

The program causes a series of 75 microsecond pulses to be output on each of four PIA terminals (PA0-PA3). The frequency of the pulse waveform on each terminal is independently controlable by data stored in the KIM-1 memory. The pulses are mixed together by a simple resistance network and coupled through a capacitor to an ordinary audio amplifier.

(D) USAGE

The program accepts three different types of coded notes: normal, compressed, and branch.

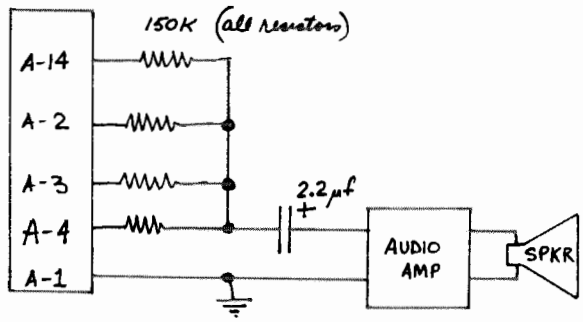

FIGURE 1.

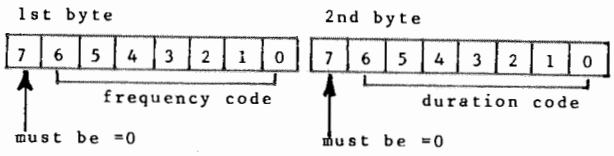
(1) Normal notes:

These notes require two bytes of storage.



Frequency code-Determines pitch of note. Refer to Figure 2 for a list of pitches and their respective codes. Notice that a frequency code of 00 (hex) specifies a rest (no tone generated).

Duration code-Determines length of note. The note will be held for the number of counts specified by the duration code. The codes in Figure 3 are recommended for most work.

Examples: 33 08 causes middle C to be played for eight counts. (eighth note)
2E 20 causes A above middle C to be played for 32 counts. (half note)

After the note is over, the playing program goes to the next consecutive byte in storage to fetch the next note.

	79	(-1.19)	
			72 (+1.97)
	6C	(-4.42)	
	66	(-5.47)	
			60 (-0.51)
	5B	(-7.91)	
			56 (-10.07)
	51	(-6.38)	
	4C	(+3.92)	
			48 (-2.47)
	44	(-3.51)	
			40 (+1.43)
	3C	(+13.17)	
			39 (+1.97)
	36	(-4.42)	
MIDDLE C	33	(-5.47)	
			30 (-0.51)
	2D	(+11.21)	
			28 (-10.07)
	28	(+15.12)	
	26	(+3.92)	
			24 (-2.47)
	22	(-3.51)	
			20 (+1.43)
	1E	(+13.16)	

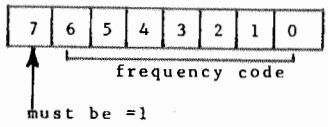
Frequency codes are in hexadecimal. Numbers in () are the relative tuning in cents. This is to provide some idea of how out-of-tune the notes are (a pitch difference of 6 cents can be detected only by very sensitive ears).

figure 2.

(2) Compressed notes:

If several notes with the same duration are to be played in succession, they can be shortened to one byte each, conserving considerable amounts of memory space.

The pitch will change to that specified by the new frequency code. The duration code, however, will remain the same as it was for the last note.



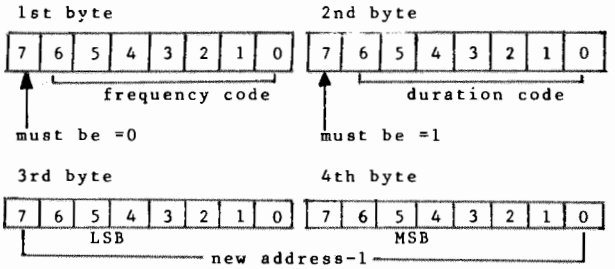
Example:

This is how the C scale would be coded:

```
66 20
58 10
D1
CC
C4
BC
B6
33 40
```

(3) Branch notes:

Branch notes are similar to normal notes, however, instead of going to the next consecutive address in memory for the next notes, the branch note causes the program to jump to a new address for the next note. Branch notes require four bytes in storage.



When the branch note is over, the next note played will be the one with its 1st byte at the new address. Branch notes are useful for making a song repeat, and for skipping unusable addresses in memory.

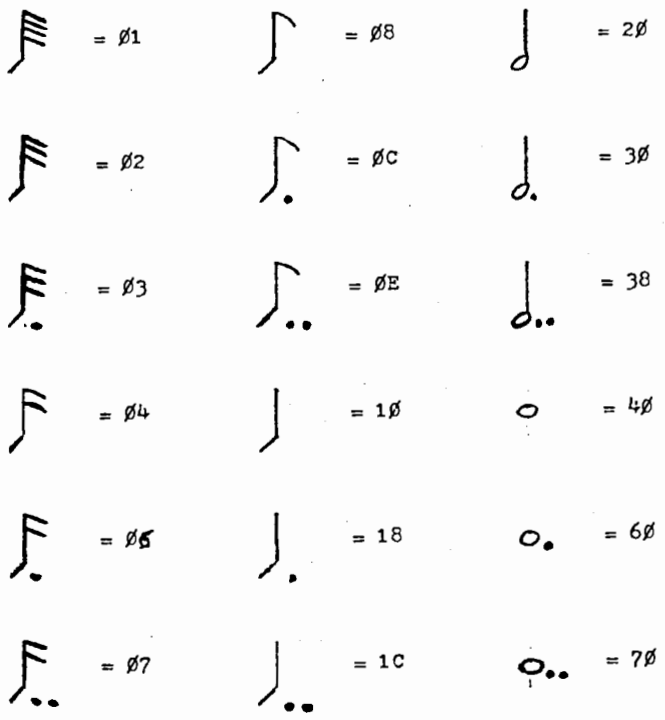


Figure 3

(E) PROGRAMMING TECHNIQUES

(1) Locations 0000-00CB and 0100-010F are used by the playing program. All other locations may be used for music data. Music data normally resides from 0110-03FF.

(2) The stack pointer should always be set to 0A before loading music data. Otherwise, the stack may overwrite the music data.

(3) Keep in mind that the playing program is capable of playing four independent melodies simultaneously. The melodies or "parts" should be placed one after another in memory.

(4) Once all four parts have been loaded, the playing program's internal pointers and counters must be initialized as followw:

```
ADDR
0008  LSB
          Starting address-1 for the first part
0009  MSB

000A  LSB
          Starting address-1 for the second
          part
000B  MSB

000C  LSB
          Starting address-1 for the third
          part
000D  MSB

000E  LSB
          Starting address-1 for the fourth
          part
000F  MSB
```

Locations 0010-0017 must be set to 01. The tempo is set at location 0007. Tempos range from 10-FF with FF being the slowest.

The playing program can now be started at location 0000.

(5) The playing program "slurs" the notes together (no seperation between the notes). Therefore:

cannot be coded as : 44 10 or 44 10
44 10 C4

To make the notes sound seperate, remove one count from the first note and insert one count of rest between the two notes. The example above would then be coded as:

```
44  0F
00  01
44  10
```

Similar techniques may be employed to give staccato notes.

(6) An optional patch may be inserted into the program to make the fourth part sound an octave lower:

(refer to program listing)

Change loc. 009C from 40 to CC. Then Add:

```
00CC    A6 16       LDX  DURD
00CE    E4 17       CPX  XDURD
00D0    D0 04       BNE  Q
00D2    06 26       ASL  PD
00D4    06 27       ASL  XD
00D6    4C 40 00 Q  JMP  TONE
```

The patch occupies locations 00CC-00D8. Similar routines may be written for the other parts if necessary.

```

DEMO TUNE TABLE

This song table occupies locations $0110-$0318. Before loading this song table in by hand or by cassette, BE SURE TO set the stack pointer to $0A by entering $0A into location $00F2 (SP). This is important!!! Remember that RESET will reset the stack to $FF. By the way, the name of the song is "Here's That Rainy Day" by Van Heusen.

Oh yes, so that the music program knows where the music table is, you must fill in the following data in the music program's pointer locations:

$0008 0F 01
$000A CF 01
$000C 4F 02
$000E CF 02

CIRCULAR LIST PROCESSING SUBROUTINES

Jim Adams
17272 Dorset
Southfield, MI 48075

Did you ever wish you had a stack for data storage which wasn't messed up by interrupts and subroutine calls? How about a stack where you could easily get at the first thing put on instead of the last? These circular list (or stack) processing subroutines perform the pointer, data and counter manipulations to reduce the above functions to subroutine calls.

A circular list is a block of memory which wraps around at the ends (figure 1). The last slot and the first slot are next to each other. The subroutines use four pieces of information about each list. The number of available slots tells when to wrap around and when the list is full or empty. The current top and next bottom point to the data. This information is kept with each list in the order shown in figure 2.

To initialize a block of memory to be used as a list put the address of the list in $EC (low, high) and the number of slots (n) you want in $EA, then JSR INL. Use JSR INLO when n is in register A instead of in $EA. The number of slots will be set to n and the other three parameters will be set to 0.

To add data to the list, put the address of the list in $EB, $EC and the data in $EA, then JSR ATL or JSR ABL. Or you can put the data in register A and JSR ATLO or JSR ABLO. If the list is full the V bit will be set, the list will remain unchanged and $EA will contain the data. If the list is not full the V bit will be clear, $EA and register A will contain the data, N and Z will reflect the value of the data, and the data will be added to the list.

To remove data from the list, put the address of the list in $EB, $EC then JSR RBL or JSR RTL. If the list is empty the V bit will be set. If the list is not empty V will be clear, $EA and register A will contain the data, N and Z will reflect the value of the data and the data will be removed from the list.

This version restricts the list and its parameters to a page so the maximum number of slots in any list is $FC. If you ask for more slots the parameters will be overwritten with data. If you ask for more slots than remain to the end of a page then the extra slots are at the beginning of the same page, not the next page. The V bit is set with BIT $1A09. This is a location in the KIM monitor containing a $40. To use the subroutines with SYM or AIM change $1A09 to any location where bit 6 is set (e.g., to an RTS location). Location $FC is used for temporary storage.

Circular lists can be used as first-in first-out buffers for asynchronous data transmission, queue storage, breadth-first search storage, failure sequence analysis, order preserving sorts, fixed sequence delays among other things. They can also be used like the 650X stack as first-in last-out buffers for depth-first search storage and reentrant subroutine storage.

HUDSON DIGITAL ELECTRONICS INC.

THE HDE DISK SYSTEM.

HERE'S WHAT ONE USER HAS TO SAY . . .

REPRINTED BY PERMISSION FROM THE 6502 USER NOTES - ISSUE NO. 14

PRODUCT REVIEW of the HDE DISC SYSTEM by the editor.

A number of you have asked for details about the HDE full size disc system.

The system is based around the SYKES 8" drive with the 6502 based intelligent controller.

This drive is soft sectored, IBM compatible, and single density which lets you store about a quarter megabyte of data on a disc.

The system software, called FODS (File Oriented Disc System), manages sequential files on the disc much the same way files are written on magnetic tape - one after another. When a file is deleted, from a sequentially managed file system, the space that the file occupied is not immediately reallocated, as in some disc operating systems. As it turns out, this can be an advantage as well as a disadvantage since deleted files on the FODS system can be recovered after the file has been deleted. (This has saved my sanity more than once!) Of course when you want to recover some of the disc space taken up by a number of these deleted files, you can simply re-pack or compress the disc and all the active files will be shifted down until there are no deleted files hanging around using up space.

FODS has this ability to repack a disc.

When saving and loading in FODS you work with named files, not track and sector data or I.D. bytes. This makes life a lot easier. I've seen some disc systems where you have to specify track and sector info and/or I.D. bytes. What a pain that can be!

If you just want to save a source file temporarily, you can do that on what's known as "scratch-pads". There are two of these on a disc, "scratch-pad A" and "scratch-pad B", each of these temporary disc files can hold up to 16K or if "B" is not used, "A" can hold one file up to 32K in length. The only files that can be temporarily saved on scratch pad are files that have been built using the system text editor.

Being a dyed in the wool assembly language programmer, I really appreciate the FODS text editor! This line oriented editor is upwards compatible with the MOS/ARESCO editor but includes about everything you could ask for in a line editor. There is a full and semi-automatic line numbering feature, lines can be edited while they are being entered or recalled and edited later, strings can be located and substituted, the line numbers can be resequenced, the file size can be found, the hex address of a line can be known and comments can be appended to an assembly file after it has been found correct. Oops! forgot to say lines can also be moved around and deleted. This isn't the complete list of FODS editor commands, just the ones that immediately come to mind.

Another very powerful feature of the system is the ability to actually execute a file containing a string of commands. For example, the newsletter mailing list is now being stored on disc. When I want to make labels, I would normally have to load each letter file and run the labels printing program. But with FODS, I can build up a "JOB" file of commands and execute it.

The job file in turn calls each lettered label file in and runs the label printer automatically. The way computers are supposed to operate right?

Here's a listing of the job file I use to print mailing labels:

```

```

Remember the MOS/ARESCO assembler I reviewed several issues ago? Well HDE went and fixed up all the problem areas that I mentioned in the review and then took it several steps further. The HDE assembler is an honest to goodness two-pass assembler which can assemble anywhere in memory using multiple source files from the disc. The assembler is an optional part of the system.

If you're the kind of person (as I am) who enjoys having the ability to customize, modify, and expand everything you own - you'll enjoy the system expansion abilities FODS has to offer. Adding a new command is as simple as writing the program, giving it a unique three letter name and saving it to disc. Whenever you type those three letters the system will first go through its own command table, see that its not there and then go out and read the disc directory to see if it can find it. If it's on the disc it will read it in and execute it. Simple right? I've added several commands to my system and REALLY appreciate having this ability. Some of the things I've added include a disassembler, an expanded version of XIM (the extended machine language monitor from Pyramid Data), Hypertape, and a number of system utilities which make life easier. By the way, to get back to the system, all you need to do is execute a BRK instruction.

HDE also provides a piece of software that lets you interface Microsoft 9 digit BASIC to their disc system. The software allows you to load the BASIC interpreter itself from disc as well as saving and loading BASIC Programs to and from the disc. This particular version of the software doesn't allow for saving BASIC data but HDE mentioned that this ability may be possible with a future version.

The first thing I do with a new piece of software after I get used to using it is try to blow it up. I did manage to find a weak spot or two in the very first version of FODS (a pre-release version) but the later, release version has been very tight.

The standard software that is included with the system consists of the disc driver software, the system text editor and the BASIC software interface. Several command extensions may also be included. All the necessary stuff like a power supply, the KIM-4 interface card, and all cables and connectors are included. It took me about 45 minutes to get things up and running the first time I put the system together.

Admittedly, a dual full size disc system from HDE is probably beyond the means of most hobbyists but if you or your company is looking for a dynamite 6502 development system, I would recommend this one. I've used the Rockwell System 65 while I was at MOS and feel that dollar for dollar, feature for feature, the HDE system comes out on top. The only place the HDE system falls short when stacked up next to the System 65 is in the area of packaging. At this point, there is no cabinet for the disc drives available from HDE.

So far, I've got nothing but good things to say about HDE and their products. Everything I've received from them has been industrial quality. That includes their documentation and product support. I'm very impressed with what I've seen from this company so far and quite enthusiastic over what my KIM has become since acquiring the disc system and its associated software.

ERIC

THANK YOU MR. REHNKE!

PONG SOUND EFFECTS

George W. Hawkins, NY

Those of you who have purchased The First Book of KIM may have noticed the Ping Pong program on page 95. Did you also notice that something was missing? If you enter the bytes 20 59 03 EA starting at address 02E9, enter the bytes 20 73 03 starting at address 031A, rig up PA0 for audio output, and add the modification given below, then the program will have BEEP, BOOP, and ZONK sound effects much like the commercial versions.

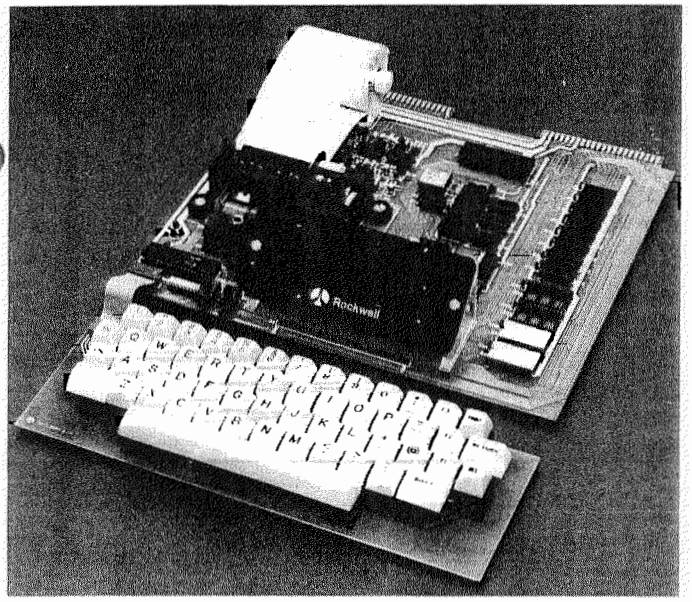
AIM 65 BY ROCKWELL INTERNATIONAL



AIM 65 is fully assembled, tested and warranted. With the addition of a low cost, readily available power supply, it's ready to start working for you.

AIM 65 features on-board thermal printer and alphanumeric display, and a terminal-style keyboard. It has an addressing capability up to 65K bytes, and comes with a user-dedicated 1K or 4K RAM. Two installed 4K ROMS hold a powerful Advanced Interface Monitor program, and three spare sockets are included to expand on-board ROM or PROM up to 20K bytes.

An Application Connector provides for attaching a TTY and one or two audio cassette recorders, and gives external access to the user-dedicated general purpose I/O lines.

Also included as standard are a comprehensive AIM 65 User's Manual, a handy pocket reference card, an R6500 Hardware Manual, an R6500 Programming Manual and an AIM 65 schematic.

AIM 65 is packaged on two compact modules. The circuit module is 12 inches wide and 10 inches long, the keyboard module is 12 inches wide and 4 inches long. They are connected by a detachable cable.

THERMAL PRINTER
Most desired feature on low-cost microcomputer systems . . .
- Wide 20-column printout
- Versatile 5 x 7 dot matrix format
- Complete 64-character ASCII alphanumeric format
- Fast 120 lines per minute
- Quite thermal operation
- Proven reliability

FULL-SIZE ALPHANUMERIC KEYBOARD
Provides compatibility with system terminals . . .
- Standard 54 key, terminal-style layout
- 26 alphabetic characters
- 10 numeric characters
- 22 special characters
- 9 control functions
- 3 user-defined functions

TRUE ALPHANUMERIC DISPLAY
Provides legible and lengthy display . . .
- 20 characters wide
- 16-segment characters
- High contrast monolithic characters
- Complete 64-character ASCII alphanumeric format

PROVEN R6500 MICROCOMPUTER SYSTEM DEVICES
Reliable, high performance NMOS technology . . .
- R6502 Central Processing Unit (CPU), operating at 1 MHz. Has 65K address capability, 13 addressing modes and true index capability. Simple but powerful 56 instructions.
- Read/Write Memory, using R2114 Static RAM devices. Available in 1K byte and 4K byte versions.
- 8K Monitor Program Memory, using R2332 Static ROM devices. Has sockets to accept additional 2332 ROM or 2532 PROM devices, to expand on-board Program memory up to 20K bytes.
- R6532 RAM-Input/Output-Timer (RIOT) combination device. Multipurpose circuit for AIM 65 Monitor functions.
- Two R6522 Versatile Interface Adapter (VIA) devices, which support AIM 65 and user functions. Each VIA has two parallel and one serial 8-bit, bidirectional I/O ports, two 2-bit peripheral handshake control lines and two fully-programmable 16-bit interval timer/event counters.

BUILT-IN EXPANSION CAPABILITY
- 44-Pin Application Connector for peripheral add-ons
- 44-Pin Expansion Connector has full system bus
- Both connectors are KIM-1 compatible

TTY AND AUDIO CASSETTE INTERFACES
Standard interface to low-cost peripherals . . .
- 20 ma. current loop TTY interface
- Interface for two audio cassette recorders
- Two audio cassette formats: ASCII KIM-1 compatible and binary, blocked file assembler compatible

ROM RESIDENT ADVANCED INTERACTIVE MONITOR
Advanced features found only on larger systems . . .
- Monitor-generated prompts
- Single keystroke commands
- Address independent data entry
- Debug aids
- Error messages
- Option and user interface linkage

ADVANCED INTERACTIVE MONITOR COMMANDS
- Major Function Entry
- Instruction Entry and Disassembly
- Display/Alter Registers and Memory
- Manipulate Breakpoints
- Control Instruction/Trace
- Control Peripheral Devices
- Call User-Defined Functions
- Comprehensive Text Editor

LOW COST PLUG-IN ROM OPTIONS
- 4K Assembler—symbolic, two-pass
- 8K BASIC Interpreter

POWER SUPPLY SPECIFICATIONS
- +5 VDC ± 5% regulated @ 2.0 amps (max)
- +24 VDC ±15% unregulated @ 2.5 amps (peak) 0.5 amps average

PRICE: $375.00 (1K RAM)

Plus $4.00 UPS (shipped in U.S. must give ***street*** address), $10 parcel post to APO's, FPO's, Alaska, Hawaii, Canada, $25 air mail to all other countries

We manufacture a complete line of high quality expansion boards. Use reader service card to be added to our mailing list, or U.S. residents send $1.00 (International send $3.00 U.S.) for airmail delivery of our complete catalog.

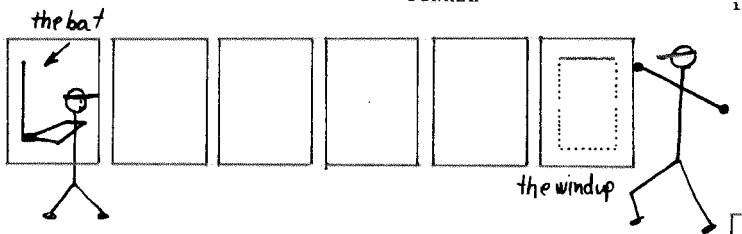
BASEBALL FOR THE KIM by Robert Leedom

(Editors note-Bob Leedom, author of Hexpawn, presents another real cute diversion for the basic KIM. Stuff like this still really excites me. I don't usually like to publish hex dumps because they are so frustrating to find your way through them, but for those of you who want to see what makes Baseball tick, you can get copies of the listing-see the ad for User Notes cassettes.)

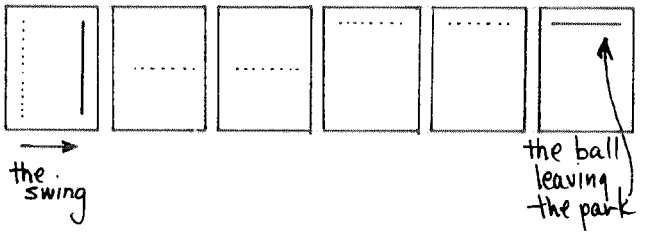
A video style action game for the KIM-1, which uses the on board LED displays in three ways.

1. You see the windup, the pitch (one of six) and the swing.

KEY	PITCH
0	SLOW BALL
1	FAST BALL
2	UP CURVE
3	DOWN CURVE
4	RISER
5	SINKER

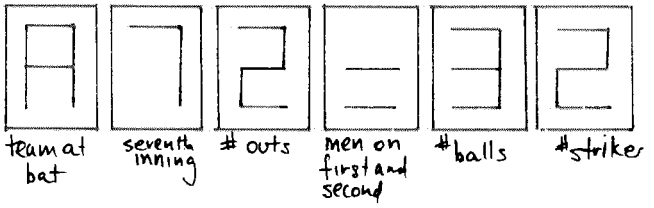


2. You see the hit (if the pitcher was able to get the ball in the strike zone, and if the batters timing was good enough)-in this case, an out-of-park home run:



...but there are also six kinds of hits!

3. You see everything you need to know about the game's progress: naturally, you'll see the umpire's calls and score, but you'll also see, just before each pitch (or at the touch of the 'PC' key during windup), a compact status display. The score may be seen during windup by pressing the '+' key.



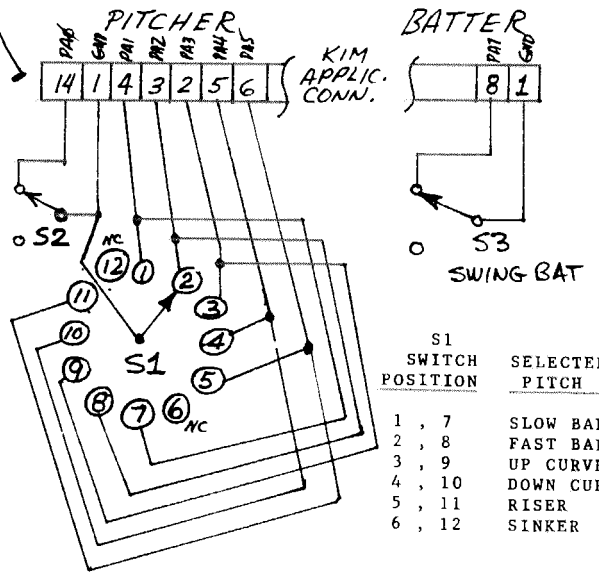
The game can be played as nine-innings worth of batting practice against KIM's pitching, or as a two player game. In batting practice, the 'team at bat' display will be blanked (of course, if the two of you are tied at the end of nine innings, the game will go into extra innings (E on the inning # display) until there's a winner!). The KIM keyboard serves as the input for pitch selection and for batting, but for about $3 worth of Radio Shack switches, you can "remote" the pitchers' and/or the batters controls! And only two data words are necessary to support these changes.

Control Word	Value of Control Word	Batting and Pitching inputs
BATTER (loc. $002B)	Positive or Zero*	Batter uses Keyboard ("B"-key)
	Negative	Batter uses remote pushbutton switch.
PITCHER (loc. $002C)	Positive	Pitcher uses keyboard (keys 0-5)
	Zero*	Computer pitches
	Negative	Pitcher uses remote rotary and pushbutton switches

*VALUE SET ON PROGRAM TAPE

KIM gives you a slight edge-if you're quick enough to pass up a fourth wild pitch for a walk, all your baserunners will advance. But the quality of pitching's pretty good-be on your toes!

REMOTE PITCH/BAT FOR KIM-1 BASEBALL



S1 SWITCH POSITION	SELECTED PITCH
1 , 7	SLOW BALL
2 , 8	FAST BALL
3 , 9	UP CURVE
4 , 10	DOWN CURVE
5 , 11	RISER
6 , 12	SINKER

PARTS LIST

S1 single pole, 12 position switch (Radio Shack 275-1385, $.99)

S2, S3 SPST switch, normally closed (Radio Shack 275-1548, 5 for $2.49)

I mounted S1 and S2 in what I call the Pitchers' Wand, a Head & Shoulders plastic shampoo bottle. (The neck of the bottle is the handle, and S1 is where the label was. S2 can be easily flicked with the thumb while holding the handle.) The reason for the 12-position PITCH SELECT switch is to make it harder for the batter to memorize switch positions and listen to clicks-for example, one click from a slow ball can either be a fastball or a sinker.

S3 was mounted in a small plastic pill bottle that fits easily into the hand.

Start Baseball at $0200. To restart the game, hit GO during the windup or during the the endgame display (six baseballs).

0000-03FF & 1780-17E6

AN EDITOR FOR MICROSOFT BASIC

from Sean McKenna
64 Fairview Ave
Piedmont CA 94610

(Editors note: How many times have you had to reenter a whole line in a Basic program just to correct one small typo? No need for that aggravation any longer. Sean is generously sharing the editor portion of his Basic Enhancements Package with us).

Character oriented editor for KIM BASIC:

1) Set the BASIC I-O calls and the I-O calls to your system as indicated in the listing.

2) The delimiter is set by the contents of $02CB (it is a backslash although appears as a ¢ in the program due to printer strangeness)

3) The command is set by the contents of $0214 to be ")" in the first position of an input line.

4) Before making any use of the program, FIXFLG and INDEX ($00ED and $00E3) must be initialized to $00.

5) To edit a program type the command ")" followed by any valid line number, backslash, material to be deleted, backslash, material to be added, backslash, CR. If the edit goes well you will get the usual "OK" prompt. If the string you specified for editing was not found you will get a "MATCH ERROR". If the addition asked for caused a line overflow you will get a "TOO LONG ERROR". If you neglect to include all three delimiters you will get a "SYNTAX ERROR". In all error situations the original line remains intact. You may delete material by not putting anything between the 2nd and 3rd delimiters. You may move a line be doing an edit on the line number itself and then deleting the original line. Line and character delete (@ and _) will operate as usual during an edit line input.

It boggles the mind to think about what Sean could do if he had a source listing to work from..... Eric

SOME BASIC HINTS FROM

Bob Kurtz
Micro-Z Electronic Systems
Box 2426
Rolling Hills CA 90274

A. Several articles have been written about programs in BASIC that provide a word processor or text editor capability. Unfortunately, BASIC uses the comma (,) and the colon (:) as commands, and if they appear in the text that you are writing - BASIC will immediately reply with an error statement. The following POKE instructions, placed early in your program, will de-activate these commands:

```
XXXX  POKE 11031,34:POKE 11035,34
```

At the end of the program, insert the following instructions to put BASIC back the way it was:

```
ZZZZ  POKE 11031,58:POKE 11035,44
```

B. Some versions of KIM BASIC will not execute the SPC command properly-but will execute it the same as the TAB command. The reason is that there was a CLC instruction improperly located. Make the following changes:

```
298B  18          298E  C9
298C  F0          298F  2C
298D  67
```

This will permit the SPC(X) instruction to space over X units from the last location on the terminal-not form the left margin.

BASIC NOTE

from Sean McKenna
64 Fairview Ave
Piedmont CA 04610

In issue #31 of Dr. Dobb's Journal there was a machine language renumber program for PET BASIC. In the current issue (#36) there are notes indicating changes which allow the program to work for KIM BASIC. Relative to the other renumbering programs which have appeared in the notes this is a vast improvement: it changes decimal numbers in a line only immediately following a GOTO, GOSUB, THEN, or ON; it will accomodate a change from any size number to any other size without any special consideration such as leaving spaces, etc.; it is very FAST, naturally. The program also revealed some interesting aspects of BASIC's mysterious inner workings which may be useful in other contexts.

PRODUCT REVIEW by the Editor

MICROSOFT BASIC ENHANCEMENTS

If you're bothered by the fact that Microsoft Basic doesn't have an automatic line number feature, a line editor, or a renumbering command, then you're in luck. Sean McKenna who shared his Basic auto-line number with us in issue #14 has come up with a dynamite mod package for the 9 digit Basic (will work with the package from Johnson Computer or Micro-Z).

This 1.25K package is written in machine code and includes the auto line number command, a renumber feature, a line editor, an append program capability and a controlled output (outputs 16 line and waits for user input). All in all, a really nice package that worked right the first time I loaded it in. By the way, getting this package interfaced to Basic was no sweat at all-since this package interfaces itself to Basic!

All that's necessary, once both programs are loaded,to start running at an address contained in the mod package. The mod package hooks itself into Basic and then jumps to Basics initialization routine. Really clean.

This mod package consists of a cassette, and a 20 page manual which includes a complete source listing (!). It sells for $20 (plus $1.50 S&H) and is available from Sean McKenna, 64 Fairview Ave., Piedmont CA 94610.

A fair price for some powerful Basic enhancements.

Eric

focal

First of all, I want to thank Dave and Don Marsh from the 6502 Program Exchange (2920 Moana Ln., Reno NV 89509) for providing me with the source listing for their version of FCL-65E. The listing has been invaluable in getting all the mods set up for both versions of FOCAL (one from Aresco and the other from the Program Exchange).

By the way, both versions must be suitably modified as per issue #14 in order to use the modifications that will be presented. Program Exchange FCL-65E users need to move the start up message at line 00.00 to the top of the 8K block by moving the data at $35D4 through $35F3 to start at $3FE0.

In trying to cooordinate these mods across two versions of FOCAL, I've run across a zero-page usage problem in the Program Exchange versions. This version uses about 50 bytes of zero-page for terminal I/O. (According to the exchange, this was done to make FOCAL more portable between different machines). Anyhow, the long and short of it is - these I/O routines will have to be moved back into FOCAL to allow freer use of zero page.

Once the line 0.0 has been moved up to the top of the 8K block, the I/O routines from $00A9-$00DC can be moved to start at location $35D4. Of course, the internal references to OUT and IN will have to be changed to reflect the changes.

FOCAL ENHANCEMENT PACKAGE

The 'NOTES' is now distributing a very useful FOCAL enhancement package that will let you save and load complete FOCAL programs on cassette as well as lines or groups of lines and/or program variables. Commands may also be executed directly from cassette. The package was written by Joe Woodard. For ordering info, see the cassette software ad in this issue.

ADDING A CASSETTE INTERFACE AND A USER FUNCTION TO 6502 PROGRAM EXCHANGE'S FOCAL 65-E

by William C. Clements, Jr.
1489 51ST Ave East
Tuscaloosa Al 35404

The FOCAL language is really a good alternative to BASIC, at least for KIM users. Of course, it doesn't have everything. The features I missed the most were a cassette interface and the ability to execute a machine-language routine within a FOCAL program. This article shows how to add tape Load and Keep commands and how to implement a "user" function similar to that of TINY BASIC. The modifications apply to FOCAL-65 (V3D) for the KIM-1 as supplied by the 6502 Program Exchange.

Listing 1 gives the code needed to add the cassette interface commands. I began it directly after the FOCAL interpreter, because I had moved the RAM allocation for program text and variables to another area. It can go anywhere in memory that you wish, with simple relocation and listing the addresses of routines KEEP and LOAD in FOCAL's command dispatch tables. The cassette Load command enters the regular KIM monitor at $1873, and the Keep command uses a Hypertape routine in my system; it's almost a necessity to use a cassette dump routine faster than KIM's, since the memory required to store the FOCAL program statements in ASCII form can be large.

The tape operations could have been done using the existing I-O handlers provided in FOCAL, but I preferred to use conventional commands. The form of the commands is L xx to load a file having hexadecimal i.d. "xx" and K xx to record a file with i.d. "xx" onto tape.

Readers who have program control of their tape recorders might want to use these commands inside a FOCAL program to manipulate tape files. I can only use them in the immediate execution mode, since I have to push buttons on the recorder. The KIM tape routines exit to loc. zero, which my code sets up with a jump instructin. Hitting the G key on the TTY after either tape operation is through will get you back into FOCAL. All starting and ending address for the tape files are automatically set by the routines, including the final address after loading a file.

The Keep routine uses Hypertape stored in my system at loc. $C400; the jump at location TAPOUT will need to be fixed by the user to suit his own system. The jump in loc. zero restarts FOCAL at its cold start, as that's the only way I can use it. If you want to get back into the middle of an executing FOCAL program, the jump at location JMPFOC and the data bytes at locations ADLOW and ADHIGH will have to be changed.

The "user" function works like the one in TINY BASIC; it allows user-supplied machine code to be executed as a FOCAL function. The FOCAL code to invoke it is S FUSR (a_1,a_2,a_3,a_4), where the a's are the four arguments. The first, a_1, must always be present because it is the address to which the program will jump to begin the user's code. a_2,a_3,and a_4 are optional. a_2, if present, will be evaluated and the least significant eight bits stored in the accumulator before executing the user's code. a_3 and a_4, if present, are similarly evaluated and placed in the X and Y registers, respectively. Thus up to three bytes may be transmitted directly from the FOCAL program to the machine code (more of course can be transmitted in either direction by using FOCAL's version of PEEK and POKE, the FMEM function). The arguments can be constants, simple variables, or any other legal FOCAL expressions, and as such have decimal values.

As examples, the statement S FUSR(8192,0,16,10) will cause a jump to location $2000 with zero in A, $10 in X, and $0A in Y. The statements

```
1.1 S A=100
1.2 S B=13
1.3 S FUSR(625-(A+B),,B,)
```

would jump to $200 with $0D in X. Note that there are always three commas, as FOCAL uses them to tell which argument is which. If you want the variable FUSR itself to have a numerical value after its execution such as FRAN or FABS do, you can have your machine code put that value into the floating accumulator FAC1 (locs. $80-83 - see p. 7 of the 6502 Program Exchange's listing of FOCAL 65-E). Your machine code must transfer control to loc. FPOPJ (in FOCAL) when it is ready to re-enter FOCAL, and it will return to the point in your FOCAL program where FUSR was invoked. Listing 2 gives the machine code needed for adding FUSR to FOCAL.

The changes required within the tables of the FOCAL interpreter to make it recognize K. L, and FUSR and to execute the codes in Listings 1 and 2 are given now. The format follows that of the original listing of FOCAL.

ARESCO	PROGR. EXCH		
$350B	$34F4	18	BYTE HFUSR
3527	3510	36	HBYTE FUSR

TINY BASIC

Editors note

Several of you were apparently confused as to how to add the Tiny Basic mods from #15 to your systems. I wholeheartedly recommend you pick up the Tiny Basic Experimenters Kit mentioned in one of the articles. (It's available for $15 from 6502 Program Exchange, 2920 Moana Ln, Reno NV 89509.

There are the major use of these registers only they may be used for other purposes on an availability basis.

TVT-6/TINY BASIC INTERFACE

by Michael Allen
6025 Kimbark
Chicago IL 60637

I had a lot of trouble getting Tom Pittman's Tiny Basic to work with the KIM-1/TVT-6 combination. Now, looking back, the input and output routines included below seem fairly simple and straight-forward. So I thought I should share these with you to help those who may be making the same mistakes I was.

The T. B. version I have resides in memory locations 0200 to 0AC6. You must change six bytes within T.B. as follows;

1. Set 0207 to C7 and 0208 to 0A. This is a jump to a subroutine to input a character. The input routine saves the return address to T.B. then jumps to the SCAN program and stays there until interrupted by a strobe signal from a key being pressed on the keyboard. If the IRQ vector has been properly set to 0AD3, a character is sent to the cursor subroutine. Then a return is made to T.B. Note that a CLI (clear interrupt status) instruction was inserted in SCAN (underlined in the hex dump).

2. Set 020A to F3 and 020B to 0A. This is a jump to the output subroutine where the miscellaneous characters T.B. sends for the benefit of a teletype are trapped before falling through to the cursor subroutine.

3. Set 020F to 08. This allows T.B. to recognize the ASCII backspace.

4. Set 028C to 0E. When starting T.B. at 0200 (cold start), this byte determines how T.B. defines the lowest address of program space.

5. Also be sure to set 17FE to D3 and 17FF to 0A.

I relocated SCAN to be able to reload T.B. from tape in one load. The version of SCAN shown is from Don Lancaster's Popular Electronics article except for bytes 0BA4 and 0BCC which were changed in order to display pages 0C00 and 0D00.

The Cursor program is adapted from Don's but is much shorter as it only supports backspace and carriage return controls--all you really need with T.B. (also INPUT sets lowercase to uppercase so you don't have to shift back and forth.)

KIM's Memory map now appears thus:

```
0020-00B9   Used by tiny BASIC
00E8-00EE   Used by I/O routines
0200-0AC6   Tiny BASIC
0AC7-0B79   INPUT & OUTPUT Subroutines
0B7A-0BDC   SCAN
0BDD-0BFF   34 bytes for USR subroutines (I put
            Don Box's subscripted variable SBR's
            here; see KUN #5.)
0C00-0DFF   TVT-6 display area
0E00-13FF   1.5K program area
```

LONE STAR ELECTRONICS

ANNOUNCES

The K/S Converter. Run KIM (MOS Technology) Software on your SYM! For the price of a blank 2716, the K/S converter enables your SYM to:

1. READ and WRITE KIM tapes at:
   - Normal Speed
   - 2 X Normal Speed
   - 3 X Normal Speed
   - 6 X Normal Speed (HYPERTAPE)
2. Run most KIM software directly (*The First Book of KIM*, for example).

The converter comes complete with a programmed 2716 EPROM and detailed instruction for installation and use.

Send check or money order for $59.95 (or order UPS COD) To:

The new MORE™ board by T.T.I. is an easy to install and use expansion for the basic KIM,* AIM,** or Kim compatible micro-computer. One unique feature of this board is it's ability to program, run or copy industry standard EPROM's--2708, 2716 (+5 & +12) or 2716, 2758, TMS 2516 (+5V only). Individual program and run personality keys and software allow the user to program from RAM or copy data from any given EPROM into any other type EPROM. (Example: Empty two 2708's into one 2716!). Additionally, the board has sockets for 3K of RAM (2114's), and two zero insertion force EPROM sockets. Also featured is a 16 Bit latchable buffered output port with two dip headers for access. Associated with this port is a row of 16 LED's arranged in binary sequence. All voltages necessary to run and program the EPROMS are generated on board. Only +5 and +12 volt supplies are required. (Approximately 200 MA from each supply).

Standard 22 pin edge connectors allow the board to be plugged onto the KIM* or Kim compatible machine. All signal lines are passed through the MORE™ board and are made available in total on standard 22 pin paddle cards.

The MORE™ board and KIM* or equivalent, make a low cost and excellent dedicated controller, educational tool, hobby computer expansion or development system.

The price with prepaid shipping in U.S. is $169.95-includes 8 personality keys, documentation, and software listings. Options---software on tape for AIM** or KIM* $10.00---Software in 2708 EPROM for $30.00.

KIMSI, S-100

16K RAM MOD

from Vince Coppola
12 Charles St.
Plantsville, CT 06479

I have installed the Digital Research S-100, 16K static RAM board sucessfully in my KIM-KIMSAI system, with only one minor modification. Remember, the board uses 2114 1Kx4 bit RAMS, so for 4K of memory all you need is 8 RAM chips. Also, the board can be depopulated to one 4K block or any multiple of 4K right on up to the full 16K. The manufacturer also states that a full blown board will draw less that 2 amps.

The modification I came up with, consists of grounding pin 75 of the board. This is done because pin 75 on the KIMSAI is not used and is therefore left floating. By grounding it and inserting the associated jumper, pin 4 of U-43 will be brought low therefore presetting the flip-flop and siabling the bank-select circuitry. Also, the enable LED should now stay always lit.

(EDITORS' NOTE-Vince also told me a little about the CGRS disk system that he has running on his KIMSI. I'll try to get more details on this system from CGRS for the next issue).

SYM ON-BOARD SPEAKER TOGGLE ROUTINE

from Bruce McKenzie

This is a subroutine to invert the state of the SYM's on-board speaker. If it is called regularly, it will produce an audible tone. Use it as you would 'INC 1700' on the KIM, or 'INC A000' on the SYM. This routine saves all registers, and is totally relocatable. As it stands now, memory locations 90D and 91C must be modified to point to an unused zero page location to hold the flag.

One final word- the speaker, being electrostatic works best at higher frequencies.

```
0090 XX          Flag location-will be either '06'
                  or '08'

SYM

SYM BASIC CASSETTE NOTES

from Eugene Garapic
14231 Thompson
Brookpark, OH 44142

I've found a bug in SYM BASIC.

The problem is that you can't save or load Basic programs from WARM START. You can see the problem if you leave Basic and then re-enter Basic through the WARM START location (so as not to clear the BASIC program). You'll find it impossible to save the program on tape in the Basic format.

Fortunately, the fix isn't difficult. Simply key in the following machine language program when you want to re-enter Basic. Install this routine in high memory as not to interfere with your Basic program.

```
20 86 8B JSR ACCESS; UNPROTECT SYSTEM RAM
4C 00 00 JMP WARMSTART; AND RE-ENTER BASIC
```

WARM START is at location $0000 and jumps to location $C27E. COLD START is at $C000 and jumps to $DE6D.

As for the SYM cassette interface:

Put a capacitor in series with the SYM audio output for 1000% better results. Why? Because this isolates the D.C. component in SYM's audio output from the recorder input. (a .01 uf works fine).

The cassette recorder must have enough power to drive SYM's LED recording indicator or else you are working in the critical mode and will get unpredictable results. Use a recorder with at least 1 watt output. The SANKYO ST-50 (available locally for about $40.00) cassette recorder has a tape counter, automatic shutoff, and works great with SYM.

AIM info

Some Useful
AIM NOTES

from Al Davidson
5746 Ballenmoor
Memphis TN 38118

Rockwell has come up with the KIM owner's finest fantasy. Easy-on-the-eye display, easy-to-operate cassette interface, easy-to-peck-on-keyboard, easy-to-use printer; It's all there, 6502 fans!

The bare AIM 65 is a prize alone, not to mention basic, which is at last her (got mine 6/20).

This is certainly the machine for the bells and whistles addict, but you want more? Here are a few tried and true suggestions-----

2MHZ OPERATION-Cut the run on top of the board connecting pin 12,Z10 to pin 5,Z10. Connect pin 12 to the common on a spdt switch. Also connect pin 5,Z10 and pin 8,Z10 to the remaining two terminals on the switch. This allows you to select 1 or 2MHZ operation. The printer operates a great deal less than perfect at 2M, and of course, the cassette info will be twice as fast. This may or may not agree with your recorder, but it performs 200% with the superscope mod# C-108. A more elaborate means for switching may incorporate the CS line for Z32, which is used for both printer and cassette. This could slow the clock down to 1MHZ when the cassette or printer are being "spoken" to.

By the way, doubling the proc. speed has no detremental effects on the machine when running basic along with an extra 4K of 2116 memory added on-board piggy-back style. Fast-Basic fans, take note!! (This is however, recommended for on-board systems only.)

more→

2716's- The ROM sockets on-board can easily be used for 2716 (5V) eproms. Cut the run under the socket connecting pin 18 to all, and jumper 18 to gnd. Since the 2716 is only a 2K eprom, it appears twice in memory; at the first and second 2K boundarys of the socket. If you don't mind that, plug 'em in!

KIMSI-The AIM is billed as being hardware compatible with KIM-close! But no cigar! The difference (other than obvious address decoding brought out to the connectors) is in the generation of RAM R/W on pin E-Z. The KIM circuit nands buffered phase 2 with inverted R/W. The AIM nands buffered phase 2 with buffered R/W. El Wrongo! But easy to remedy, if you're surgically inclined. First, disable the sys R/W to pin 4, Z13. Cut the trace at pin 4 and also the trace that runs under the cip and towards Z32. Now, jumper pin 4,Z13 to pin 5,Z16, which is the correct phase of the R/W line. Now, to re-establish R/W to Z32, jumper pin 22,Z32 to pin 6,Z16. This takes care of the RAM R/W difference.

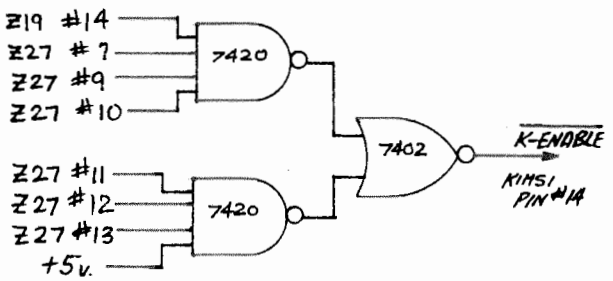

FIG 1. GENERATES NEW K-ENABLE SUITABLE FOR AIM MEMORY MAP. SEE ALSO KIMSI MANUAL PAGE A4 (3) FIGURE 'C'.

Next, to accomodate AIM's memory map, we have to create a new K-enable. This is explained on page A4(2) of the KIMSI manual, but the general idea is to tell the KIMSI to turn itself off when the proc. is "talking" to a device on it's own board. I used the circuit in fig. 1 on a small piece of breadboard mounted on the AIM. This, I thought, was better than running 8 lines to the KIMSI prototype area. As explained in the KIMSI manual. The KIMSI decoding circuitry has to be disabled by cutting the "V" shaped run under the board at Z11, pin 11.

Now, connect the new K-enable line to KIMSI pin 4 and enjoy!

These two mods render a trouble-free machine, as far as AIM-KIMSI interface goes, but the extra circuitry along with the added lead length to the KIMSI prohibits the use of a 2 MHZ clock.

The 9-digit Microsoft Basic-in-ROM is certainly worth the 100 bucks. Room is provided on board for the ROMS. The peek and poke statements make access to ports and memory convenient, & the 'wait' statement provides high-level port-watching that's easy. Access to user machine language routines could have been easier, but at least it's provided for. Cassette save & load commands are certainly worth honorable mention, too.

This is a real 8K basic, with an impressive list of string handling and arithmetic functions not to mention the usefulness of the error codes and good documentation.

Although the basic is well incorporated into the AIM system using the keyboard, printer, and display, user I/O may easily be used instead, as with all the other AIM I/O functions. (I'm using a KENT-MOORE video board in the KIMSI for output).

AIM TAPE PROBLEMS

from Steve Bresson
1666 Independence Ct
Severn, MD 21144

I have found two problems with the AIM65, both in the tape I/O area.

I. The first is in using the LOAD, (L), command to input object code from tape. When the last record of a file occurs within 6 or 7 bytes of the end of a BLOCK, the loader will either hang up while looking for another block of input, or give an ERROR when it finds another block, which does not have the correct block number.

The error is in the LOAD ($E2E6) program. It first reads the record length, and then the ADDRESS/# of Records, depending on the type of record. If the record length in 00, then the record is the last in the file, and it attempts to read (5+1=)6 bytes from the input buffer. But there are only 3 bytes left from the valid input data , so that if there is enough garbage at the end of the buffer, nothing will happen. When the last byte of the record occurs in the last 2 bytes of the buffer, the input routine attempts to read another block to get the additional data. This causes the hang-up/error.

	1	5	1		
BEGIN FILE	BLK#	FILENAME	ØD	RECORD / RECORD	
NORMAL RECORD	";"	#BYTES	STARTING ADDR.	DATA	ØD
LAST RECORD	";"	ØØ	# RECORDS	CHECKSUM	ØD

The error can be easily shown by the following procedure:

1) place known data in $200-220
2) do a DUMP, (D), to tape, (T) and dump the following blocks of data in one file:
   $200-217,
   $200-207,
   $200-209.
3) rewind the tape and check it using the verify, (3), command. This should show no problems
4) rewind again, and attempt to load, (L). When it hangs, do a RESET, and look in the tape buffer ($116-165). Your data should be there along with the record data.

NOTE: While this problem may not occur too often, it can be a pain when it does, if you do not know what is happening.

II. The second problem is an incompatability between the AIM BASIC tape output and that used by the TEXT EDITOR, and expected by the verify, (3) command. The text editor puts out, and expects to receive a text file ended with a double (CR). Basic can read a text editor file as long as a (ctl-Z) is the last character in the file before the (CR) (CR). But, when Basic writes a file, it puts out a (CR) (LF) (CR) (LF) (CTL-Z) at the end. Both the editor and verify hang-up when reading this.

SOME PERSONAL VIEWS ON HOW AIM COMPARES...

by Jim Butterfield
Toronto

AIM vs KIM

1. AIM cost more.
2. The AIM power supply is a bit tougher than KIM's: 24 volts at 0.5 amperes is harder to procure than KIM's 12 volts at about 0.1 amp, even allowing for the fact that the 24 volts doesn't need regulation.
3. AIM's display is larger, but tougher to work, since it's mostly planned for serial ASCII input; you can't get to individual segments as you can with KIM.
4. KIM has a more flexible system for re-arranging memory; AIM is directed more towards a completely fixed memory map.
5. AIM's built-in printer is a great bonus, even if you have to live with 20 columns.
6. The basic AIM system has spendid monitor features, including Single-step and Breakpoint, with options such as register display and next-instruction disassembly.
7. AIM also has a disassembler and mini-assembler in the basic monitor; they are very handy.
8. AIM's plug-in assembler and plug-in Basic chips make these enhancements simple to add. Extra memory (up to 4K) also goes on-board.
9. There are cassette recorder control lines for AIM, although I haven't been able to make mine work. AIM will write KIM-compatible tape; but its own format is quite nice, and the display gives you a running commentary on what's happening during saves and loads.
10. The text editor is a nice built-in feature; not an earth-shaker, but handy enough.
11. KIMs outnumber AIMs by a very large margin. There are more opportunities to find other KIM-users, programs, etc.

AIM vs PET

1. PET costs more.
2. PET's power supply is built in; you have to go hunting for an AIM power supply, and it's extra.
3. The full CRT display of the PET is of course much more useful than AIM's little 20-character LED strip. PET also has graphics and/or lower case. PET's CRT, however, increases weight and size; AIM (when suitably packaged) is far more portable.
4. AIM may be expanded on-board to 4K; depending on the model, PET may have up to 32K of RAM built in.
5. PET does not come with a printer; AIM does. It costs a fair piece of change to add a printer to PET, although such a printer would of course have more than 20 columns. AIM has a built-in teletype interface if needed; PET needs an adapter to do this.
6. AIM's monitor is excellent for machine-language work. PET's machine language monitor is much less powerful. Enhanced monitors are being passed through the PET user community, but even these don't have all the features that are built into AIM.
7. AIM Basic (an optional extra) is very similar to that of PET. Pet's is somewhat better. I particularly miss the SYS command which isn't available on AIM. Basic file handling is somewhat better on the PET.
8. PET can be expanded with disk and printer to a quite powerful standard system. AIM is capable of this, but there are no standard Rockwell products for this kind of expansion, and each user tends to be on his own.
9. PET' outnumber AIMs by a large margin. There are more opportunities to find other PET-users, programs, etc.

65XX chip family stuff

6522 USER NOTES

from John T. O'Donell
Aydin Monitor Systems
401 Commerce Drive
Fort Washington PA 19034

1. Recently attended a marketing presentation by Synertek in Philadelphia. Conrad Boisvert of Synertek introduced their 6500 family UP's and support chips including the 6522. Enclosed you will find a copy of the SY6522 spec document given out at the presentation. Haven't gone thru all of it in detail but it appears to answer a lot of questions and correct a lot of errors found in the MOS Technology document.

2. Conrad says that Synertek has corrected the problem with the shift register shifting in at system clock rate and generating 9 clock pulses per shift operation instead of 8. The corrected devices are supposed to be available now, but, according to Conrad, there is no change to the part number. Thus you have to go by date code (buy the most recent).

3. The uncorrected device can still be used for shifting in at system clock rate since it does stop shifting and generates an interrupt after 8 clock pulsrs. The extra shift clock pulse presents a problem only for the device providing the serial data. If that device readies more than 8 bits at a time in its serial output shift register then there will be a problem. However, if after each serial byte transfer the controlling UP causes the remote device to load its next byte into its serial output register then the extra clock pulse will be ignored. Naturally there is no problem if the remote device is another 6522.

4. Having said all that we come to a subtlety in the timing of the shift-in operation that will cause a problem if the remote device is other than another 6522. The subtlety involves the timing relationship of the data on CB2 to the rising edge of the shift clock on CB1: the data should be held stable for one full 02 clock cycle after the rising edge of CB1 shift pulse. In our application we wanted to load a byte of data into a 74LS299 universal shift register and then shift it into a 6522. So we connected the serial output of the LS299 to CB2 and connected the shift clock from CB1 to the SL299 clock input. We were using shift-in at system clock rate and each byte acquired was shifted left by 1 bit. When I observed that there were 9 shift clocks I thought I had the answer to the problem and called MOS TECHNOLOGY to find out what to do about it.

   I spoke to Rich Gapin there who told me that although there are 9 shift clocks the 6522 interrupts and stops shifting after 8 so that wasn't the cause of the problem. Subsequent discussion revealed the timing constraints and made apparent that there had to be an extra stage of storage between the output of the LS 299 and CB2. Consequently the serial input data goes to the D input of a 74LS74 clocked by the CB1 shift clock. Q output of the LS74 connects to CB2. The LS299 and LS74 both shift data on the rising edge of the clock. Therefore each bit shifted out of the LS299 will be stable at CB2 input immediately after CB1 clock rising edge.

A COUPLE OF 6522 APPLICATIONS NOTES

from Conrad Boisvert
Synertek Inc

SY6522 Generating Long Timed Intervals

The SY6522 Versatile Interface Adapter contains two 16-bit counter/timers for a variety of purposes, among them the generation of timed interrupts. Each counter is 16 bits long, so the maximum count-down is 2^{16} or 65,536 counts. With a 1MHz processor clock rate, this translates to a maximum time of about 65.5 msec.

In some cases, this may not be long enough. To achieve longer timed intervals, several schemes may be used. Among them are:

1. Increment or decrement a memory location each time the timer interrupt occurs. In this way, an additional factor of up to 256x can be achieved, resulting in a maximum of about 16.8 seconds. However, extra program steps are needed.

2. The two SY6522 timers may be connected externally (Figure 1), resulting in an effective 32-bit counter/timer. In this way, intervals longer than one hour may be achieved.

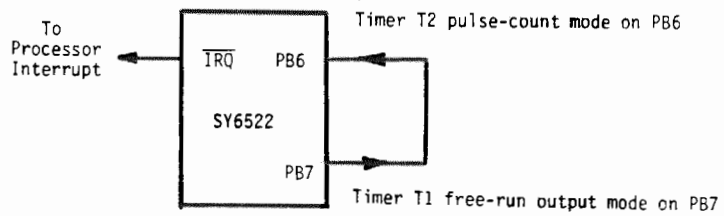

Figure 1-Connection to Use T1 and T2 as 32-bit Counter

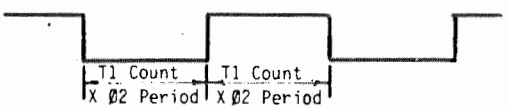
PROGRAMMING CONSIDERATIONS

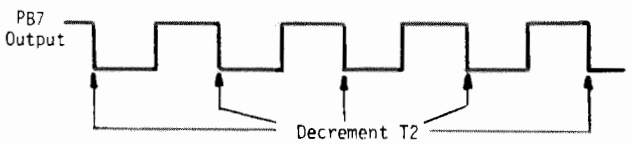
To cascade the two counters together it is necessary to do the following:

1. Connect PB6 and PB7 together. These pins will not be useable as general I/O functions in this case.
2. Program T1 mode to free-run with output on PB7.
3. Program T2 mode to count pulses on PB6 input.

In this way, the waveform on PB7 is,



Since timer T2 pulse-counting mode counts negative-edge transistions, it is clear that T2 will decrement as follows:



Thus, T2 decrements will occur at the following intervals,

T2 RATE=2x (T1 COUNT) x (Ø2 PERIOD)

And, hence, the total time will be,

T = 2x(T1 count) x (T2 count) x (Ø2 period)

Thus, the maximum is 2 X 65,536 x 65,536 x 1 us = 8590 seconds = 142 minutes = about 2½ hours.

SY6522 - GENERATING A 1Hz SQUARE-WAVE SIGNAL

The SY6522 (Versatile Interface Adapter) has two integral 16-bit timers intended to perform a variety of programmable functions. One capability is to use timer T1 to generate a continuous square-wave output on peripheral pin PB7.

The timer is clocked by the system clock, Ø2, which normally operates at 1MHz. The waveform generated is illustrated in Figure 1.

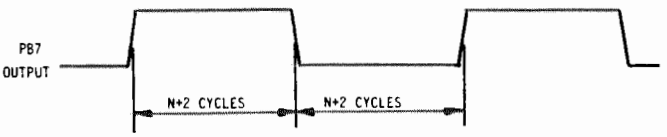


Figure 1 - PB7 output Waveform

Note that the period of the waveform is 2N+4 cycles, with a 16-bit counter, the maximum number of cycles is where N is the number set into the timer.

$N_{MAX}=2^{16}-1 = 65,535$

Hence, the maximum programmable period is

$P_{MAX}=2N_{MAX}+4= 131,074$ cycles.

This is about 131 msec for a 1MHz system clock, considerably less than 1000 msec, the period of a 1Hz signal.

One way to extend the period is to use the PB7 output signal as a clock input to the shift register on the SY6522. If a pattern of 11110000 is set into the shift register, then the output of the shift register will appear as in Figure 2.

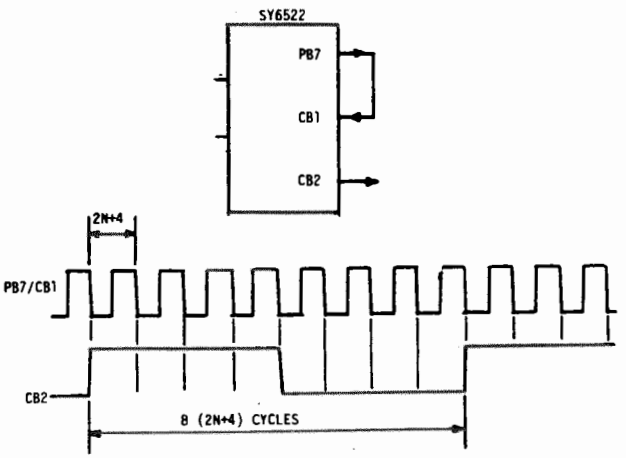

Figure 2 - Shift Register Output Waveform

Note that the period is extended by a factor of 8 by this method.

$P_{MAX}=8\ (2N+4)$

Hence, for 1 Hz, P_{MAX} = 1,000,000 and N = 62,498. Thus, it is necessary to store the number, 62,498, into the timer T1 in order to generate the 1 Hz waveform. When translated into hexadecimal format, the result is F422, and F4 is loaded into the high byte and 22 into the low. The step-by-step sequence for programming this is shown in Figure 3.

Note the expecially the following points:

* Loading the T1 high-order counter (Register 5) initiates the timer in its free-running mode.
* PB7 data direction must be set to an output for the pulses to occur.

6551 ACIA MINI-SPECS

SYNERTEK has recently released a very interesting new addition to the 65XX family. It's called the 6551 Asynchronous Communication Interface Adapter (ACIA) and is a considerable upgrade to the present Motorola 6850 ACIA. The best feature of the 6551 is the on-chip baud rate generator. The baud rate is software programmable and generates 15 baud rates (50 to 19.2 K baud) from a standard 1.8432 MHZ external Xtal. There's also an external 16X clock input for non-standard baud rates (up to 125 Kbaud). I just finished wire wrapping up an HDE prototyping card, with two 6551's which are driven by a single 1.8432 MHZ Xtal in a TTL oscillator configuration. (By the way, I'm using the lowest cost battery operated wire-wrap gun from OK Machine & Tool and it's been working like a champ. I whole heartedly recommend wirewrap for getting prototypes up and debugged quickly.)

This board will serve as the system I/O module for use by my homebrew 6512 CPU board in my "dream machine".

One of the 6551's will be used by my Hazeltine CRT while the other will be driving my printer. Both will be RS-232. Later, I may build up another board for modem control.

The 6551 is, of course, fully programmable as far as: word lengths; number of stop bits; parity bit generation and detection; interrupt operation etc. Also, modem control signals are provided. A very versatile chip indeed!

Get more info from SYNERTEK or ROCKWELL.

Eric

ouch!!!

THE CASE OF THE SWITCHED SOFTWARE

Bruce Nazarian

Sharp-eyed readers of 6502 Notes will already have noticed my inadvertent error in issue #15, re: music mods.

Author Armand Camus is, in fact, quite correct in his references to the page zero locations used in his software. Not having the original software (as published in BYTE) handy, I had no way to know his references weren't incorrect: so, be aware, you KIM music lovers-the BYTE (also COMPUTERIST) software is not the same as the Advanced Music Software being marketed by MTU.

Also, in recent conversations with Dave Cox, Marketing manager for MTU, I was advised of the existence of a NEW KIM DAC board, which Dave assures me will outperform the old DAC..It must be quite a board, as the old DAC was nothing to sneeze at! Several changes have been made, but all for the better. The new board only requires a single supply voltage (+5), and should have an improved signal-to-noise ratio over the old one. I have ordered a new one from them and will have a user's report as soon as I have it up and running.

My sincere apologies to any readers I may have caught off-guard with my software mistake, and sincere apologies to author Camus for doubting his eyesight!!!

BUGS IN #15, PAGE 4

There are some errors in the wiring sketch (fig. 4) for the dynamic RAM board. The schematic on the pre ious page is believed correct however. The problem in the wiring sketch involves placement of the address lines so the sketch is still useable once the address lines are referenced to the correct pins on the RAM chips.

BUGS IN #15 PAGE 22,23

The article by Cass Lewart, 1:32640 should be 1:32896 the ocrrect formula is:

$$(FF\ hex + 2)\quad \frac{(FF\ hex + 1)}{2}\quad K = 0$$

and the last row of numbers in the table should be: 32.9 ms, 263 ms, 2.11 ms, 33.7 sec.

Reverse the polarity of the diode placed across the 5 volt relay.

OSI

READ KIM TAPES ON YOUR OSI SYSTEM

By Robert Solomon
5868 Joanne Ct.
North Ridgeville OH 44039

In my previous letter, I stated that I was developing a high speed PLL tape interface for the OSI. After looking at the benefits of that approach, I have abandoned that idea. It would be of much greater help to the OSI experimenter to increase his access to cassette-based experimenter software.

A greater amount of 6502 experimenter software is available to the KIM owner than will probably ever be available to the OSI owner. So all that needs to be done is to make the OSI system compatable with the KIM tape format. I have an OSI 404V CPU and the owners manual says you can install a KIM chip on the board. It is not quite that easy, as I found out when I studied the operaiton of the KIM 6530 chip. The solution to that problem is explained in this article.

As I described in my previous letter, I have a 16K system consisting of two 4K boards and one 8K board. I also stated I was in the process of implementing KIM Focal 65. Focal for KIM resides at 2000 to 360A with user program above 360A. If my 16K of memory were continuous from 0000, I would only have about 2½K of user workspace. But I need to have the memory continuous for my Tiny Basic which starts at 0200. So I set up my memory as follows:

4K from 0000 to 0FFF for page zero and I/O to teletype, CRT, and KC format tape;

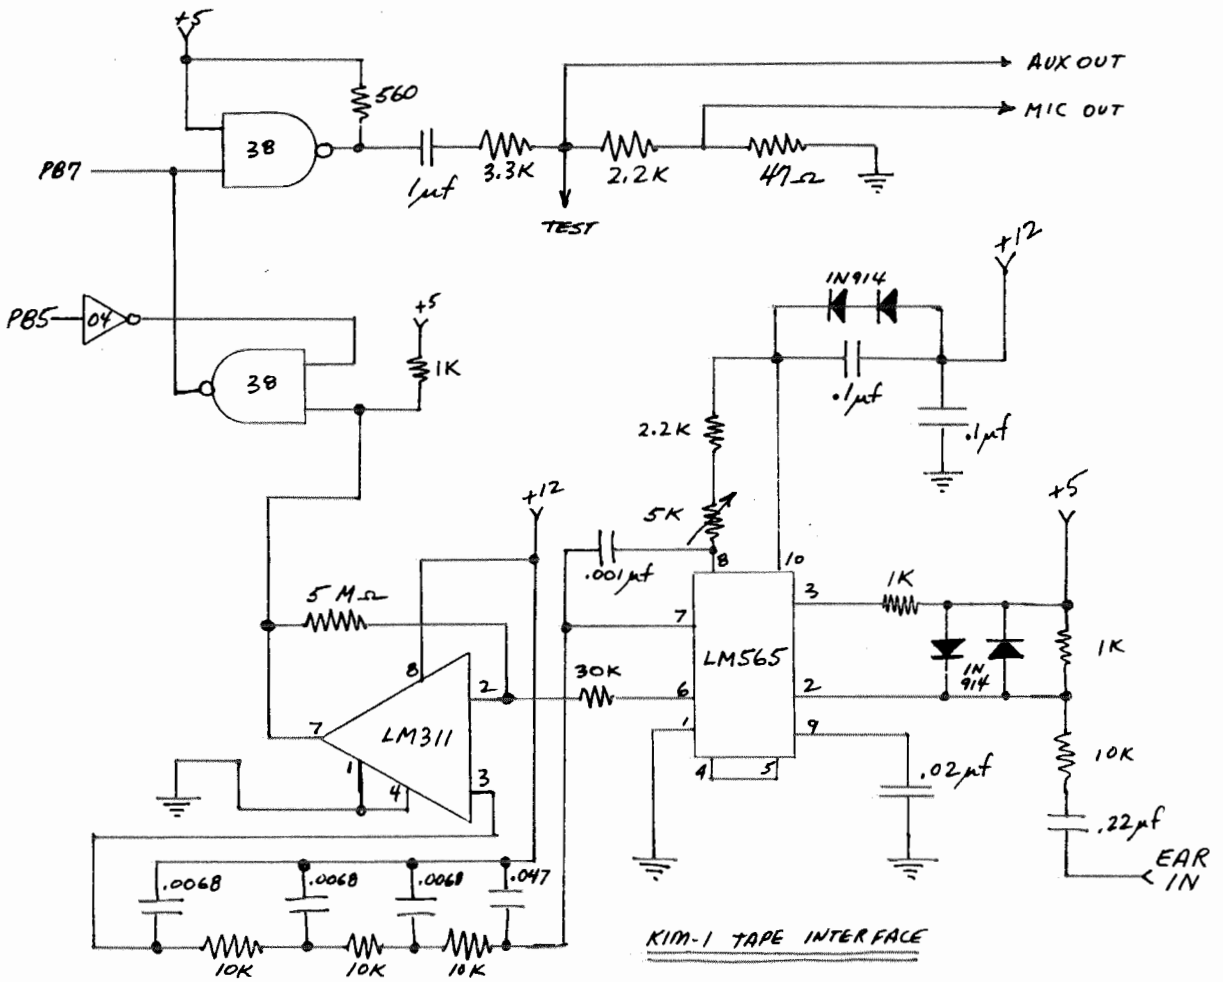
8K from 2000 to 3FFF for general use (including Focal); and 4K which can be placed at either 1000 ro 1FFF ro 4000 to 4FFF controlled by a front panel DPDT switch.

Now I can run either Tiny or Focal and have workspace located as needed based on the front panel switch position. I also plan on using 9-digit Microsoft KIM Basic located from 2000 up.

All I need is a method to load KIM tapes into the OSI. There is also a high speed tape format for KIM called hypertape; and Lou Edwards has available a 4800 baud Zip-tape system for KIM. It would be nice to be able to use these on the OSI.

Implementing the 6530 chip was not quite as simple as one would expect. In order to understand the problems, you need to understand the KIM program. (Anyone contemplating using the KIM simulator should get a copy of the KIM-1 Users Manual.)

Each 6530 includes 1K of ROM, 64 bytes of RAM, i/o ports, and a timer. The 6530-002 chip ROM contains the KIM keyboard, display, and TTY operating programs. The 6530-003 chip ROM contains the tape interface program. The problem is that the -003 ROM program uses the RAM, I/O, and timer on the -002 chip! The tape programs also exit to a location in the -002 ROM.



KIM-1 TAPE INTERFACE

The solution to this problem is shown in the second schematic. I managed to fit it all on the CPU board, but I recommend putting it on a separate board. Then you could install the tpae interface circuit on the board also. (A prototype board is available from D&N Micro Products, 3932 Oakhurst Dr., Fort Wayne, IN, 46815, for $27.00 including postage, handling, and connectors.) My solution involved circuitry to make the 6530-003 use its own RAM, I/O, and Timer for the tape functions. I also implemented a 1K RAM at 1C00 to 1FFF and the tape program will exit into this RAM.

The 7404, 7420, and 74145 decode the six high order address lines to provide the selects for the 6530 I/O, Timer, and RAM. (K5 to CS1 for 1400-17FF); 6530 ROM (K6 to RS0 for 1800-1BFF); and the 1K RAM (K7 to 2102 CE for 1C00-1FFF) Address lines A0 thru A9 go directly to the 6530 except for A6. The proper handling of A6 is really the solution to the whole problem.

The selection between the 6530-002 and the 6530-003 is made by RS0 and A6. When RS0 is low, A0 thru A9 must directly access the 6530. RS0 for the 003 is connected to K6 and the RS0 for the 002 is normally connected to K7. I use K7 to select the 1K RAM instead of the 002 chip. When RS0 is high, the 6530 is selected by CS1 being low. Both the 002 and 003 respond to K5 connected to CS1. The 002 and 003 are distinguished by the status of A6. A high on A6 selects the 002 and a low on A6 selects the 003.

So all we have to do is invert A6 to select the 003 I/O, RAM, and Timer for the tape interface. I used the 7486 Exclusive-OR gate to perform this function. When K6 is low (ROM Select) A6 is not inverted and we have access to the tape program in ROM. When K6 is high (at all other times) A6 is inverted and we have access to the 6530-003 RAM, I/O, and Timer to support the KIM tape interface.

The 1K RAM is necessary because the tape ROM program exits to an address in the 6530-002 ROM program. Unless we have something at that destinaiton, the machine could run wild and do who knows what to the program. An advantage of having this 1K RAM is that you can run KIM programs as is, with appropriate vectors or subroutines in the 1K RAM. This will make it unnecessary to make patches within the main program in many cases.

You will notice that there is a disable switch in the 6530 circuit. Since my system has that movable 4K block of memory, I cannot have the 6530 or 1K RAM functional when the block is located at 1000-1FFF. I have done this by disabling the 7420 decoder IC and by forcing the R/W low to both the OR-wired 7403 on the 1K RAM and the 6530. This prevents both systems from putting data onto the data bus when they are disabled.

Now that we have the hardware, we need the software to make it work. At this point, I will leave this up to the reader. In the future, I plan to submit software information. (Boy! what a sneaky way to make you subscribe to User Notes). Besides, I have to leave room in this issue for other stuff.

WHAT IS KIMATH?

Some of you have asked for more details on the KIMATH program that we are making available.

KIMATH is a group of floating-point math subroutines capable of performing operations up to 16 decimal digits of precision. The functions supported by KIMATH include ADD, SUBTRACT, MULTIPLY, DIVIDE, LOG, ANTILOG, TANGENT, ARTANGENT, and SQUARE ROOT: Special subroutines are included to evaluate polynomial expressions, which can be used to approximate most math functions.

It should be stressed that KIMATH is not a complete math package, only a group of subroutines. (I/O routines are left up to the user). This means KIMATH is totally independent of any operating system dependencies and makes this package useful for most any 6502 based machines, (such as SYM & AIM) not just KIM.

Basically, you would load one or two special register areas (each register can be up to about 20 bytes in length) with the number (s) to be worked on and then call the proper subroutines in KIMATH to do the operation. KIMATH only operates on numbers in an unpacked BCD format, but routines are provided to convert to and from other data formats such as packed BCD, and unpacked ASCII for easier storage and output data formatting. (That's right, KIMATH does its calculating in BCD, not binary).

A useful addition to KIMATH, called MATHPAC, was published in Doctor Dobbs Journal! (volume 2 Issue #10). MATHPAC provides the needed I/O routines and a host of other features, such as variable storage and extended computational ranges not possible with KIMATH alone. MATHPAC needs 2K of additional memory.

Additional info on KIMATH should be gotten from the KIMATH manual - available for around $15.00 from several sources including:

Johnson Computer
P.O. Box 523
Medina Oh 44256
216-725-4560

A B Computers
Box 104
Perkasie Pa 18944
215-257-8195

Falk-Baker
382 Franklin Avenue
Nutley NJ 07110

The KIMATH manual contains a complete source listing of KIMATH.

KIMATH ON CASSETTE OR EPROM FOR AIM, SYM & KIM & APPLE

KIMATH is now available assembled to any location, and comes with a sorted symbol table for easy routine lookup.

ON KIM COMPATIBLE CASSETTE FOR AIM,SYM,KIM $20.00

ON 2Kx8 5v. EPROM (TI 2516 or INTEL 2716) $80.00
(APPLE VERSION IS ONLY AVAILABLE ON EPROM)

ORDERING INFORMATION:

You must include the following information with your order for cassette and EPROM versions of KIMATH:

Hex starting address for main program (normally $F800)
Hex starting address for 23 bytes of zero-page storage (normally $0000)
Hex starting address for 154 bytes of RAM for the argument registers (normally $0200)

ORDER FROM:

REVIEWS ETC.

PRODUCT REVIEW by the Editor

THE MORE BOARD FROM T.T.I.*

Frankly, I wasn't exactly overjoyed when I received this product for review. After all, why should 3K of RAM expansion turn me on when I had over 10 times that much on my regular system.

My big change in attitude concerning the MORE board came after I realized that my other EPROM burner just would not program the Texas Instruments 2716 because of incompatabilities.

I even started to design an EPROM burner that would program the TI2716 when I suddenly realized that the solution to the problem was already at hand.

Upon a closer look at the MORE board, I discovered a very nicely engineered EPROM programming system which works with all of the popular EPROMS (2708, INTEL 2716, TI 2716, and 2516) eliminates the need for any voltages besides the usual KIM +5 and +12, and includes enough RAM on-board to solve the problem of how to burn a 2K EPROM when you have only 512 bytes of useable RAM.

The MORE board has turned my spare KIM into an EPROM programming system which has twice the capability of some of the commercial EPROM programming units at a fraction of the cost.

I haven't gotten around to burning the TI2716 yet, but I have put my disk system bootstrap into a 2708. The board performed flawlessly. Since MORE has two on-board EPROM sockets (one for programming and the other mapped into normal memory space), EPROMS can easily be copied. Of course, the EPROM burning software (which is included with the MORE in the form of complete source listings) can be relocated and burned into a 2708 for semi-permanent storage in the memory-mapped EPROM socket if you really don't need this copying capability.

The only negative things I can say about the MORE board are that I had to do a little trimming on the connector to get it hooked up to KIM and the preliminary documentation has a few soft spots.

A small file took care of the first problem and the second problem, according to T.T.I., is in the process of being corrected.

I forgot to mention that the board appears to be of industrial quality with all IC's socketed and two quick load zero insertion Textool sockets for the EPROMS. No EPROMS or RAMS are included. MORE comes fully assembled and, according to T.T.I. can also be used on the Rockwell AIM system.

I'm happy with the MORE board, plan on using more EPROMS in the near future and will probably cause a real scene when T.T.I. asks for their board back!

MORE is available for $170 from T.T.I., POB 2328, Cookeville, Tn 38501.

PRODUCT ANNOUNCEMENT

FLOPPY DISK FOR THE AIM-65

COMPAS Microsystems (224 S.E. 16th St, Ames, Iowa 50010) announces availability of a mini-floppy interface for the AIM-65.

"The base price of $850 includes DAIM controller board with all operating system in EPROM, power supply and one packaged disk drive. Price for an additional drive is $350. The components of the DAIM system may also be purchased on an individual basis if the user desires. Delivery is stock to sixty days. The system is currently in production. A complete operating manual will be supplied for evaluation purposes for the nominal charge of $5."

6502 FORTH

* 6502 FORTH IS A COMPLETE PROGRAMMING SYSTEM WHICH CONTAINS AN INTERPRETER/COMPILER AS WELL AS AN ASSEMBLER AND EDITOR.
* 6502 FORTH RUNS ON A KIM-1 WITH A SERIAL TERMINAL. (TERMINAL SHOULD BE AT LEAST 64 CHR. WIDE)
* ALL TERMINAL I/O IS FUNNELLED THROUGH A JUMP TABLE NEAR THE BEGINNING OF THE SOFTWARE AND CAN EASILY BE CHANGED TO JUMP TO USER WRITTEN I/O DRIVERS.
* 6502 FORTH USES CASSETTE FOR THE SYSTEM MASS STORAGE DEVICE
* CASSETTE READ/WRITE ROUTINES ARE BUILT IN (INCLUDES HYPER-TAPE).
* 92 OP-WORDS ARE BUILT INTO THE STANDARD VOCABULARY.
* EXCELLENT MACHINE LANGUAGE INTERFACE.
* 6502 FORTH IS USER EXTENSIBLE.
* 6502 FORTH IS A TRUE IMPLEMENTATION OF FORTH ACCORDING TO THE CRITERIA SET DOWN BY THE FORTH INTEREST GROUP.
* SPECIALIZED VOCABULARIES CAN BE DEVELOPED FOR SPECIFIC APPLICATIONS.
* 6502 FORTH RESIDES IN 8K OF RAM STARTING AT $2000 AND CAN OPERATE WITH AS LITTLE AS 4K OF ADDITIONAL CONTIGUOUS RAM.

6502 FORTH PRICE LIST

KIM CASSETTE, USER MANUAL, AND COMPLETE ANNOTATED SOURCE LISTING ($2000 VERSION) $90.00
PLUS S&H 4.00

OUR USER MANUAL ASSUMES SOME PREVIOUS KNOWLEDGE OF FORTH.

KIM

TIM

AIM 65 - 4th Qtr. '79

SYM - 1st Qtr. '80

SINGLE DRIVE	**$ 795.00**
DUAL DRIVE	**$1195.00**

Complete with all hardware. Interconnecting cables, FODS, text editor and user and installation manuals.

The HDE DM816-MD1 Mini Disk System is the peripheral you have been waiting for. No longer bounded by long and unreliable cassette saves and loads, your computer becomes a sophisticated system for program development or general purpose use. With the HDE Mini-Disk you load and save programs in seconds, not minutes or hours. And, since all transfers to and from the Mini-Disk are verified for accuracy, the data will be there when you need it.

The HDE DM816-MD1 Mini-Disk has been "systems" engineered to provide a complete and integrated capability. Software and hardware have been built as a team using the most reliable components available. The systems software includes the acclaimed and proven HDE File Oriented Disk System and Text EDitor, requiring only 8K for the operating software and overlay area. Systems expanding programs available include the two-pass HDE assembler, the Text Output Processing System and Dynamic Debugging Tool. Hardware includes a Western Digital 1771 based controller in a state-of-the-art 4½ x 6½" card size, Shugart SA 400 drive and the Alpha power supply.

The storage media for the DM816-MD1 is the standard, soft sectored 5¼" mini diskette readily available at most computer stores, and HDE has designed the system so that the diskettes rotate only during disk transactions, favorably extending media life. A disk formatter routine included with the system, formats the diskettes, verifies media integrity by a comprehensive R/W test and checks drive RPM. Additional utilities provide ascending or descending alpha numeric sort, disk packing, text output formatting, file renaming, file addressing and other capabilities.

HDE PRODUCTS. BUILT TO BE USED WITH CONFIDENCE.
