Prints with built-in format or lets you create your own: center, underline. Boldface, elongated, proportional and condensed print.

Inserts and deletes characters, lines or blocks of text.

Duplicates and moves blocks of text.

Searches for and/or replaces words or phrases, one at a time or all at once.

Prints double columns, form letters, multiple copies of a page or document, at the touch of a key.

Changes line spacing, margins, print type, paragraph indents anywhere in the document.

Instantly reformats.

Enters text easily, with word wrap, one main menu and helpful prompts.

Creates multi-line headers and footers.

Numbers pages and creates section numbers automatically.

Corrects spelling (with extra software). Chains and merges files.

Has "print preview": you can check your copy before it's printed.

You can't find a friendlier, more powerful word processor at twice the price. New AtariWriter." Under \$100.

Now you can do multi-featured word processing at home, simply. At a family budget price.

Our ROM-based cartridge technology means you can use new AtariWriter on any ATARI® Home Computer (even 16K) for personal and business correspondence, term papers, committee reports, mailings, etc.

It also lets you choose between cassette and

disk storage systems.

One very special AtariWriter feature: you can correct as you write, without switching back and forth between Create and Edit modes.

And our memory buffer offers an "undo" command to let you change your mind, and restore text you've just deleted.

Check into our remarkable AtariWriter, and our choice of letter quality and dot matrix printers, also reasonably priced, at Atari dealers. Call 800-538-8543 for dealer nearest you. In California, call 800-672-1404.

You'll do more with Atari Home Computers.

Presented by **EGold Disk***

Featuring the finest in educational and home utility software for the Apple:

ANIMATION GRAPHICS: PAINT PROGRAM

Powerful yet easy-to-use shapes creator and animator for the novice or experienced graphics artist. Apple II or IIe, 48 K. 1 drive. \$35.00

ANIMATION GRAPHICS: SUPER SLIDE SHOW

Powerful slide show creator for novice or expert. Apple II or IIe, 48 K. 1 drive. \$29.00

INTRODUCTORY SPECIAL: NOW THROUGH JANUARY 31, 1984: Buy both the PAINT PROGRAM and the SUPER SLIDE SHOW together for one low package price of \$45.00.

SCANDURA MICRO-TUTOR II SERIES (Grades 1-5)

Interactive and individualized instruction disks with hi-res graphics and the latest advances in cognitive theory. By Dr. Joseph Scandura, specialist in structural learning.

- **Complete Tutorial Arithmetic Series** (4 disks complete). A total system to pinpoint your child's needs in arithmetic and get results. Apple II or IIe, 48 K. I drive. \$135.00. With Diagnostic Pre-Test Option, \$160.00.
- Complete Language Arts Series (8 disks complete). Helps identify the language skills needed by your child and improves them dramatically. Apple II or IIe, 48 K. 1 drive. \$400.00

LOCUS MICRO-TUTOR (All Grades)

Allows an educator to build a customized course for students on any subject matter with C.A.I. instruction disks. Can also print and store test materials. No programming knowledge necessary. Apple II or IIe, 48 K. 1 drive. \$59.95.

LITMAS DATA SYSTEM

High-speed system for data storage, retrieval and statistical analysis. Written by Eric Sohr, M.D., LITMAS is the only cross-indexing data base for the Apple, with up to 512 keywords possible, and up to 2048 combinations of keyword phrases possible. LITMAS' speed is derived from its unique "bit map" structure. Delightfully-easy to use, excellent manual. Apple II or IIe, 48 K. 1 drive. \$145.00

BRAHMAN HOME HEALTH DISK

Comprehensive medical information program. Written by an E.R. physician, this program can help you live healthier and possibly save someone's life. Factual, inclusive, consumer-oriented . . . Covers emergencies, injuries, drugs, treatments, etc. 2 full disks with 15 programs. Apple II or IIe, 48 K. 1 drive. \$79.95. Annual update available.

PRO-FORMA TAX PREPARER/TAX BREAK ANNUAL

On time and reliable since 1981 — never missed a year's update. A sophisticated tax optimizer which quickly determines the lowest tax by automatically taking into account every benefit, loophole, exclusion, adjustment and credit possible. User-oriented and very fast, typically taking 3 minutes from data input to return preparation. Program generates a detailed 7-page tax summary report indicating what form, line number and amount to be entered to obtain the very lowest tax. Also contains a unique "AUDIT POTENTIAL SCORE" which compares your return with that of a typical taxpayer with the same income, alerting you to any unusually high deductions that could trigger an audit. Apple II or IIe, 48 K. 1 drive. \$129.95. Annual update available.

Distributed by MOMENTUM through your local dealer, or call national order agent for VISA/MC or C.O.D. order at 1-800-368-2260 in Maryland, 301-592-5949. Or write to MOMENTUM, 300 W. 31st St., Baltimore, Md. 21211.

Outsmart your computer.

Show your computer who's boss. Earn its respect. With a Datamost book.

No matter what age or ability level you're at, we have the right book that talks just to you. And your computer. Whether you own an Apple.* An Atari.* Or just about any brand.

All our books are incredibly easy to understand.

Which will make it incredibly easy to understand your computer.

What If You're Scared Of Books About Computers?

Don't be.

Our books are written in friendly, familiar American English. Highlighted with cartoons. And illustrations. So they're fun to read. As well as educational.

And there's over 30 books to choose from. Basic computer learning books to programming books to coloring books.

You won't be bombarded with complicated programming routines until you're ready for

complicated programming routines. And no funny technical talk until you've reached the level where you don't think it's funny.

We'll tell you what you need to know. And then, when that's understood, you can take the next step toward outsmarting your computer.

Before You Spend Big Bucks On A Computer, Spend Little Bucks.

Once you've decided, kind of, almost, nearly, what type of computer you think you'd like to buy, buy a Datamost book.

It'll help you understand the Atari or the Commodore* or the Apple of your eye.

Before you spend a lot of money. Before you take your computer home.

You'll make a better purchase decision. Because you'll understand what you're doing. And what you and your computer can do together.

So there won't be any misunderstandings to ruin your new relationship.

How To Get The Most Out Of Your Computer. Get the most out of our minds.

Datamost books for
every computer.
Everybody. Every level.

↑ Pretty smart, huh?

MICROSPEC

SOFTWARE MEANS BUSINESS FOR THE COMMODORE 64

When it's time to get serious, it's time to boot up MicroSpec business software. Our complete line of business software is made to give you some real applications for your Commodore 64. From data base management to full accounting software, we have the package for you.

It's attention to detail that makes our packages so beautiful and makes them stand out from the rest. We realize that most people are first time users, so we designed all our packages to be completely menu driven and user prompted for each input. We also know that most people use only one disk drive, so we designed all our packages to virtually eliminate disk swapping. Other features like non destructive input routines really make our software easy to use. But all this doesn't restrict you. Pure random access file structure maximizes your disk capacity and allows you to bring up any record for viewing in less than a second.

In our efforts to put together the best packages available, we worked on more than the software. We took the same approach with the documentation as the software. We made it complete and easily understood for the first time user. We even provide sample reports in many cases.

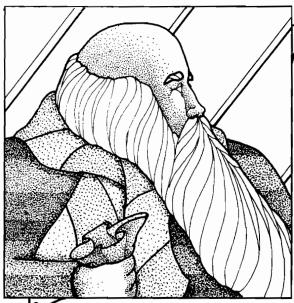

The Demonstration Package, which shows how each program runs, is available for \$19.95. So, if you're serious about your 64, call or write for a complete brochure or go right down to your nearest computer retailer for a demonstration.

WHEN YOU AND YOUR 64 ARE READY TO GET DOWN TO BUSINESS

FEATURING PROGRAMS FOR THE VIC-20 AND THE COMMODORE 64.

BOUNTY HUNTER

\$24.95*

An adventure in the Old West. Journey back with us into the days of Jessie James and Billy the Kid where the only form of justice was a loaded revolver and a hangman's noose. In this full-length text adventure, you play the role of Bounty Hunter, battling against ruthless outlaws, hostile Indians, wild animals and the elements of the wilderness with only your wits and your six gun. Average solving time: 20-30 hours. If you love adventures, this one is a real treat.

Available for COMMODORE 64 and the VIC-20 (with 8K or 16K expander). Available on TAPE or DISK. Played with JOYSTICK.

KONGO KONG

\$24.95*

Climb ladders, avoid the barrels the crazy ape is rolling at you, and rescue the damsel. Commodore 64 version features 4 different screens!

Available for COMMODORE 64 and VIC-20. Available on TAPE or DISK. Played with JOY-STICK.

GRAVE ROBBERS

\$19.95*

Introducing the first GRAPHIC ADVENTURE ever available for the VIC-20 or COMMODORE 64! With realistic audio-visual effects, you explore an old deserted graveyard and actually see the perils that lie beyond.

Available for COMMODORE 64 and VIC-20. Available on TAPE or DISK. Played with KEY-BOARD.

CHOMPER MAN

\$24.95

Don't let the bullies catch you as you gobble the goodies! This program has 8 screens and still fits in the standard memory.

Available for COMMODORE 64 and VIC-20. Available on TAPE or DISK Played with JOY-STICK or KEYBOARD.

VICTORY SOFTWARE

Micro Calc — What is it?

icro Calc is a calculation program, not entirely unlike the spreadsheet programs described elsewhere in this issue. It is much simpler than a program such as VisiCalc, and that simplicity results in both advantages and disadvantages. This is not a spreadsheet program, so it is limited to much simpler calculations. However, as you will see from some of the examples presented later, there are many applications for such a quick calculational aide. All you need to know is the rules for BASIC arithmetic expressions.

In this issue we offer a ten-line version for an unexpanded VIC-20 with cassette. We also offer a 15-line version for the TRS-80 Color Computer, 20-line versions for the Commodore 64, PET, and Atari 400/800/1200, and a 23-line version for the Apple.

Haven't I seen this before?

presented in the March, 1982, issue of MICRO. A number of typographical errors in that listing have been corrected, and there have been several improvements. The VIC-20 version now includes the following additional features:

multiple statements on a line No. 67 - December 1983

- convenient implementation of programmable function keys
- optional zeroing of user variables

The Apple, Commodore 64, and PET versions have added:

- multiple statements on a line
- ✓ function key implementation (C-64)
- optional zeroing of user variables
- ✓ disk support, with file name display
- ✓ error trapping (Apple)
- ✓ a total of 20 lines for calculations
- reparate comment lines, one opposite each calculation line

The Atari version, presented here for the first time, allows limited use of IF...THEN, FOR...NEXT, and other BASIC constructions. The Color Computer version, also new, provides 15 lines for calculation, multiple statement capability, and file name display.

How to Use Micro Calc

See the article in each section of the magazine for listings and specific in-The ten-line version was first structions. Below are general instructions.

> RUN the program. The screen will fill with a sample screen. This is designed to calculate the monthly payment on an installment loan. On the Commodore 64 and the VIC-20, press the F7 key; on the others press the "@" key. The cursor will disappear for a few seconds, and then a number will appear

next to the P? on the last line. This is the monthly payment calculated on an \$8000 loan for 48 months at 11.9%. You may now move the cursor to the end of any line and delete and retype to try a different calculation. See what happens if the loan goes for only 36 months, or at only 9.9%, or if you decide to borrow \$10000.

There are two kinds of statements allowed - assignment and value request. An assignment takes the following form:

[variable] = [BASIC numeric expres-

where [variable] is any single-letter floating-point variable name.

A value request takes the following form: [variable]?

Typical assignments include:

A = X + 3J = SIN(X + 3*A)P = Y = 5

Assignments may be combined on a single line by using semicolons or colons (see instructions for your implementation):

A = 5:P = 3.14159265:Z = TI

A=
M=
I=
I=I/1200
D=(1-(1+I)^-M)/I
P=A/D
P=INT(P*100+.5)/100
P?

PAYMENT: Calculates monthly payment, given starting balance A, number of months M, and annual interest rate I

K=
F=3280.B336*K
F?
M=INT(F/5280)
G=F-M*5280
F=INT(G)
I=INT((G-F)*12+.5)
M?
F?
I?

METRIC CONVERSION: Converts kilometers to miles, feet, and mearest meh.

T= U= C= P=3.14159265 V=180-T-U V=P*V/180 U=P*U/180 B=SIN(U)*E/SIN(V) B?

SOLVE TRIANGLE: Calculate a second side of triangle, given two angles in degrees) and included side.

A= B= V= V=3.14159265*V/180 D=A^2+B^2 E=2*A*B*EOS(V) C=SQR(D-E) C?

SOLVE TRIANGLE: Calculate third side of triangle, given two sides and included angle.

Value requests may not be combined with any other statement on one line.

How it works

The Micro Calc program is written almost entirely in BASIC. None of the floating-point variables named with a single letter is used in the program itself. This allows the user all 26 of these variables on the screen. When the F7 or "@" key is pressed each assignment statement is POKEd into a special area of memory called the input buffer. Then a BASIC ROM routine is called to tokenize the expression. Finally another ROM routine that assigns variables (the BASIC LET function) is called to evaluate the expressions. With the Commodore versions, the machine code is only 48 bytes.

The Atari version works a little differently. It uses an alternate screen on which you do your typing. Then, when you press the calculate key ("@"), the lines you have typed are copied to the actual BASIC screen (which is kept hidden from the user) and RETURNs are executed on each line to execute the statements in the immediate mode.

Atari BASIC is quite different from the BASICs on the other computers. The discussion below applies primarily to these other computers. Many of the things discussed will not work on the Atari. The Atari version has extra powers, such as IF...THEN and FOR...NEXT support, though. See the Atari section for details.

When to Clear the Variables

he latest version of Micro Calc 'allows you to clear the variables at your discretion. This process is only done automatically when the screen is cleared or or when a screen is SAVEd or LOADed. What are the advantages? If you type in the screen marked "DISTRIBUTE", you will see a good reason why the variables aren't cleared automatically on each calculation. Notice that the line labeled "BALANCE" at the top of the screen assigns a value to the variable B. This is where you type in the starting balance for your loan. The final calculation results in a new value for B. If you now go to the end of the top line and delete it entirely, the calculation will be performed using the B calculated in the previous calculation. Without automatic recalculation, variable M acts as a counter, incrementing once

each time the calculation is repeated. If the first line is left intact, though, the same calculation will be repeated, and, assuming nothing is changed, all the variables except M will come up with the same values as the previous time. If you want to zero M, you can just hit the zeroing key (F8 on C-64 and VIC, double quote on the Apple, and CLEAR on the CoCo), or you can explicitly assign M a value of zero as part of a multiple statement on the first line.

Making a Decision without IF...THEN

The "DEC-TO-HEX" screen demonstrates how to make decisions without using IF...THEN (which is not allowed in Micro Calc). The problem we want to solve is how to get the same screen to work on both signed and unsigned decimal integers. There are two ways to look at a 16-bit binary number. If unsigned arithmetic is used, all 16 bits are used, so 1111 1111 1111 1111 is considered to be the equivalent of the decimal number 65535. If signed arithmetic is used, the most significant bit indicates whether the number is positive or negative. If the bit is on, the number is negative and the absolute value is determined by taking the two's complement. This same binary number that is 65535 in unsigned arithmetic is 1 in signed arithmetic.

The solution is to test for positive or negative within an arithmetic expression. This is done in the line labeled "SIGNED". The expression D<0 tests whether the original decimal number is negative. If it is, -1 is assigned to the expression, it's multiplied by -16, and 16 is added to the value of H, which is negative. What this really accomplishes is taking the two's complement of the most significant hex digit whenever the original decimal number is negative. The other three hex digits are calculated properly, whether the calculation is signed or unsigned. The Apple and Atari assign 1, instead of -1, to a true statement, so your calculations should reflect the difference. In this example, you would type H = H + (D < 0) * 16 for the Apple or Atari. This decision making capability is used similarly in the "HEX-TO-DEC" screen. The variable S is used as a flag: if it is less than 0, then the result is calculated as signed; if it is 0 or greater, then the result is calculated as unsigned. The same change must be made for Atari or Apple screens. Other

applications of this decision-making ability would be testing a divisor to avoid a fatal ?DIVISION BY ZERO ERROR, and testing a counter to see if it has arrived at a specified maximum.

Getting More into Less Space

The Color Computer and VIC-20 versions of Micro Calc offer less space for calculation due to memory or screen-size limitations. On the VIC-20, each line is only 20 characters long, and on both computers there are fewer lines available. Two techniques may be used to get around these limitations.

Multiple statements may be used to perform two short assignments on the same line. For instance, in the "HEXTO-DEC" screen, the statements D=D+J*16 and D=D+K may be combined into one line by separating them with a colon (semicolon on Commodore machines): D=D+J*16:D=D+K.

Statements that are too long to fit on one line may be broken into two separate statements by using an *intermediate result*. For instance, the statement $J = INT(I \cdot D \cdot B \cdot 100 + .5)/100$ may be replaced (as is it was in the "DISTRIBUTE" screen) with two separate statements: $J = I \cdot D \cdot B$ and $J = INT(J \cdot 100 + .5)/100$.

Micro Calc Program Description

Notes on all programs

Of necessity, all of the comments in the following description do not necessarily apply to all of the programs. The reader is cautioned to take such comments as 'color' to apply only if your computer has the specified function.

Initialization (A)

The screen is cleared and the border and screen color set. The call to subroutine, READs in the bytes of the machine language program from the DATA statements and POKEs them into memory. A number of constants are defined, including the carriage return, delete, and other control characters. The number of lines is set and the arrays are dimensioned accordingly. A subroutine is called, which fills the arrays from the remaining DATA statements to make the sample

START BAL DE DAYS/PER. PAYMENT P= ANN % DAILY DEC I=I/36500 J=[*D*B INTEREST J=INT(J*100+.5)/100 (ROUND) TO PRINC C=P-J E=1NT(E#100+.5)/100 (ROUND) COUNTER M=M+1 TO INT. J? TO PRING. C7 M? # PERIODS B=B-C NEW BAL B? 4

The following screens require more than ten lines. See the text for techniques to squeeze more assignments into less space.

DISTRIBUTE: Calculate distribution of monthly payment to interest and principal Enter the requested values for the starting balance B, days/period D, payment P, and annual interest rate I. To continue beyond the first month, perform the calculation once, then delete the first line. The new balance will be retained as the starting balance for the next calculation. The counter M will increment once for each calculation.

DEC INPUT D= H=INT(D/4096): I=D-H*4096 MS DIGIT J=!NT(1/256);(=1-0*256 L=INT (K/16) M=K-L*16 LS DIGIT H=H-(D<0)#16 SIGNED? 10=A **J**? 11=B L? 12=C М? 13=D 14=E 15=F

(Commodore use;)

(Atari and Apple use: H = H + (D < 0) * 16)

DEC-TO-HEX: Calculate hexaderimal equivalent of decimal integer in the range - 32768 to 65535.

MS DIGIT **I** = J= k m LS DIGIT D=H*4096 D=D+1*256 D=D+J*16 D=D+K D=D+(H<O)*65536 SIGNED? DECIMAL D? A=10B=11 C=12 D=13 E=14 F=15

(Atari and Apple use: D = D - (H < 0) * 65536)

HEX-TO-DEC: Calculate decimal equivalent, given four-digit hex number. To interpret as negative number, precede first digit with - sign.

angramgemenghamgemengramgemeng

screen. The sample screen is displayed. Then the cursor is positioned for the first line, and a branch is made to enter the normal loop. If you want to skip loading the sample screen, delete the appropriate line.

Main Program Loop (B)

In general, the program consists of testing for characters from the keyboard. Certain characters are considered to be control characters and must be dispensed with in special ways. Some of these involve branching to subroutines; others are dealt with immediately. Characters that aren't control characters are either accepted and added to the end of the current line, or they are rejected. After each character is processed, the flow usually goes back to the main loop. If the next character begins a new line, then a branch is made to reposition the cursor.

Whenever the screen is cleared, the arrays are cleared and the screen blanked. If the new line contains a value request statement, then the line is blanked out to remove the printed value. The current line is printed, followed by the cursor. Characters from the keyboard are processed. Control characters are tested and other characters are added to the current line.

If the character causes the length of the line to be exceeded, then a cursor down or return is executed. Then the line number counter is incremented and tested. If maximum lines has been exceeded, then the necessary adjustments are made to start work on the first line. Otherwise, the cursor is positioned at the beginning of the next line.

Delete is handled by checking for an empty line. The necessary screen display parameters are set, and strings are adjusted with the LEFT\$(| function.

The up-cursor character is handled in the following manner. If the new line is 0 then the line counter is set to maximum lines, and the cursor is adjusted accordingly. Otherwise, the cursor is moved up one line.

The calculation command branches to a subroutine which handles the calculation and printing the results. The cursor is positioned at the end of the top line after the calculation.

Comment Field Handling (C)

The operation here is very similar to that of the calculation field. Things are simpler, though, since nearly every character is is allowed. Everything is printed in light green, and the remainder of each line is left unreversed.

Input Subroutine (D)

This is called by the main editor program. The various control characters are tested, then for the other characters. Acceptable ones cause return, while unacceptable ones fall through to get another character. This continues until an acceptable character is received.

Calculation Processing (E)

The calculation process may take several seconds, depending on the screen contents. Each line is examined with value request statements handled by one subroutine. The requested variable is placed into the appropriate element of the string array. An illegal line, with fewer than three characters, is skipped. Other lines are handled by the subroutine where the values are assigned by the machine language routine.

Assignment Handling (F)

Each assignment line is POKEd into the input buffer, character by character. Whenever a colon (semicolon) is encountered, that line is processed (a zero is POKEd for the Commodore programs). When the end of the line is reached, the machine-language routine is executed, and the RETURN goes back to the calling routine.

Get Character (G)

The GET function accepts any character from the keyboard. If there is no character, then the program loops until there is.

File Handling (H)

The subroutine handles SAVEing the calculation and comment arrays. Similarily, the LOAD subroutine handles loading these arrays from tape or disk. Some of the programs check for disk errors and print error messages or allows a new file name.

The prompt portion sets up a number of variables according to the responses. A disk or tape variable is set and appropriate file name strings established to either READ or WRITE a sequential file. Then the proper channel is opened and the arrays either read from or written to the output device. (The Commodore routine includes an additional subroutine to reread the

machine-language routine back into the cassette buffer, since all or part of it was destroyed during the file operation.) Then the screen is redisplayed, containing the old contents if it was a SAVE operation, and the new contents if it was a LOAD.

Value Request Processing (I)

As each line is processed in the subroutine, only lines ending in a "?" are sent here. Therefore, the first character is the variable name. Each letter is converted into a number from 1 to 26. Flow of control is passed by the ON...GOSUB structure with 26 possible branches. The rest of this subroutine consists of small subroutines, one for each letter of the alphabet. The value of the named variable is assigned to the appropriate element of the value array.

Screen Print With Values (J)

This causes the whole screen to be printed with values shown after each "?" The values are converted to a string using the STR\$() function, and the remainder of the line is filled out with the appropriate number of reversed underline characters.

Read Machine Language Routine (K)

The DATA statements contain the individual bytes of the machine-language program. The READ statement is used for each byte, and it is POKEd into succesive bytes of memory. This routine is called once at the start of the program, and (for Commodore) again whenever a LOAD or SAVE operation takes place.

Print Screen (L)

The first time the subroutine is called, it prints the standard start-up screen. Later, the screen is printed with current array values and comments. Each screen line is printed according to the contents of the arrays. The current file name, if any, is printed at the bottom of the screen.

Clear User Variables (M)

Each of the user variables is set to zero. This routine is used when using successive calculations, such as A = A + 1, to start over with different values.

The rest of the program consists of the DATA statements used for the machine-language program and the initial screen contents.

80 COLUMN PRINTER SALE—\$149.00*

*STX-80 COLUMN PRINTER-\$149.00

Prints full 80 columns. Super silent operation, 60 CPS, prints Hi-resolution graphics and block graphics, expanded character set, exceptionally clear characters, fantastic print quality, uses inexpensive thermal roll paper!

DELUXE COMSTART/F PRINTER—\$219.00

The Comstar T/F is an excellent addition to any micro-computer system. (Interfaces are available for Apple, VIC-20, Commodore-64, Pet, Atari 400 and 800, and Hewlett Packard). At only \$219 the Comstar gives you print quality and features found only on printers costing twice as much. Compare these features.

- . BI-DIRECTIONAL PRINTING with a LOGIC SEEKING CARRIAGE CONTROL for higher through-put in actual text printing. 80 characters per second.
- PRINTING VERSATILITY: standard 96 ASCII character set plus block graphics and International scripts. An EPROM character generator includes up to 224 characters.
- INTERFACE FLEXIBILITY: Centronics is standard. Options include ElA RS232C, 20mA Current Loop.
- . LONG LIFE PRINT HEAD: 100 million character life expectancy.
- THREE SELECTABLE LINE SPACINGS: 6, 8 or 12 lines per inch.

- . THREE SELECTABLE CHARACTER PITCHES: • 10, 12 or 16.5 characters per inch. 132 columns maximum. Double-width font also is standard for each character pitch.
- PROGRAMMABLE LINE FEED: programmable length from 1/144 to 255/144 inches.
- VERTICAL FORMAT CONTROL: programmable form length up to 127 lines, useful for short or over-sized preprinted forms.
- . FRICTION AND TRACTOR FEED: will accept single sheet paper.
- 224 TOTAL CHARACTERS
- USES STANDARD SIZE PAPER

If you want more try

Premium Quality COMSTART/F SUPER-10X PRINTER-\$299.00

More Features Than RX-80

For \$299 you get all of the features of the Comstar T/F plus 10" carriage 120 cps, 9 x 9 dot matrix with double strike capability for 18 x 18 dot matrix. High resolution bit image (120 x 144 dot matrix), underlining, backspacing, left and right margin settings, true lower descenders, with super and subscripts, and prints standard, Italic, Block Graphics, special characters, plus 2K of user definable characters. For the ultimate in price performance the Comstar T/F Super 10" leads the pack!

Double **Immediate Replacement** Warranty

We have doubled the normal 90 day warranty to 180 days. Therefore if your printer fails within "180 days" from the date of purchase you simply send your printer to us via United Parcel Service, prepaid. We will IMMEDIATELY send you a replacement printer at no charge via United Parcel Service, prepaid. This warranty, once again, proves that WE LOVE OUR CUSTOMERS!

Spreadsheets

by Phil Daley

What does a Spreadsheet Do?

here are many software packages on the market today which have a multitude of uses for business and accounting applications, whether you own a multi-national conglomerate or are managing your own checkbook. Some are fill-in-the-blank accounting programs designed with a specific job or a specific set of jobs in mind. These are usually known as accounting packages: general ledger, accounts receivable/payable, payroll, and others. Many are designed to be general in nature, so that you can program your own particular functions into the software. These are spreadsheet packages that can do accounting functions, as a well as act as a mini data-base. Some are designed to be project oriented with specific abilities to organize and layout planning strategies. Others are designed to be multi-purpose with planning and spreadsheet capabilities combined.

This month we plan to concentrate on spreadsheet packages — how do they work, what do they offer and who can benefit from them. While each product has its own syntax and specifications, many of the features can be found on all of the spreadsheet packages and a look at the generic options will give you an overview of what they can do.

The standard display screen is a series of columns (normally designated alphabetically) and rows (normally designated numerically), blank at the beginning. Each intersection of row and column has a name [A1,C67,GG145...]. These individual blocks are called "cells".

Each cell can contain one piece of information. You can define the size and type of the individual cells, or whole columns or rows. The size parameter can help save space on the screen by keeping the columns close together. The type parameters (such as Label, Integer, \$, left or right justified...) help prevent input errors and neaten the appearance of the screen format. Each cell can be a number (value), name (label) or computation (formula). Values can be positive or negative, integer quantities or floating-point constants; labels can be names or numbers; formulae can contain any of the allowable computations grouped in any desired manner by use of parentheses. Cells can also reference other cells by name. If cell D8 contained B5, then the value of D8 would be the same as the value of B5. If it contained @SUM(A1...A124), then the value of D8 would be the sum of the values contained in all the cells from A1 through A124.

The real advantage to an electronic spreadsheet program is the instant feedback for each calculation entered. Upon entering a formula, the spreadsheet is immediately

recalculated (assuming recalculation is turned on), and the value presented on the screen. This gives you a 'rough estimate' glance to see if the formula is at least in the ballpark. Normally, when writing a program to perform calculations, you don't get a chance to see the output of any particular formula until you run the whole program, or at the minimum, a compilable module.

Basic Functions

In addition to the standard + - */< >and $^ \land$, most spreadsheet programs contain functions similar to the following:

@ABS	Return absolute value
@AND	Return TRUE if all TRUE
@AVERAGE	Calculate mean of list
@EXP	Raise e to a power
@FALSE	Return FALSE

@IF Select value based on condition

@INT Truncate value
@LN Return natural log
@LOG Return log base 10

@MAX Return maximum value in list
 @MIN Return minimum value in list
 @NOT Return TRUE if FALSE else FALSE
 @NPV Calculate Net Present Value of list at dis-

count rate

@OR Return TRUE if any TRUE

@PI Return value of Pi

@ROUND Round a number to specified places

@SQRT Return the square root
@SUM Calculate the sum of a list

@TRUE Return TRUE

Many of the newer spreadsheets also contain transcendental functions, standard deviation, internal rate of return and other specialized accounting functions.

@ACOS	Arc-cosine function
@ASIN	Arc-sine function
@ATAN	Arc-tangent function
@COS	Cosine function

@DIF Calculate the difference of a list
@FRA Return the fractional part of expression

@IRR Return the internal rate of return @PDIF Return the percentage difference

@SIN Sine function

@STDDEV Return standard deviation of a list

@TAN Tangent function

IA JEB JEC JED JEE JEF JEG JEH JEL JEJ JEK JEL JEN JEN JED JER JER JES JET JEU JEV JEN JEK JEZ JEAAJEABJEACHADJEAEJEAF

There are many different commands to operate on a worksheet, I will mention a few that should be considered when buying a spreadsheet software package. All have cursor movement from column to column, and row to row. Some allow movement to rows and columns by multiple movements. In addition to particular formats mentioned above, some work sheets allow "hidden" cells (the data is not displayed). You should be able to set the width of columns. The replicate command should have a "relative" copy, to copy cells with row and column orientation included. Most work sheets allow "windows", either horizontal or vertical screen splitting, with synchronous or unsynchronous scrolling. Some packages allow a "data save" to a textfile that can be operated on by a BASIC program, data base manager, mailing list or text processor.

Who Can Benefit?

19-

22-

23-

25-

45

There are many uses for a spreadsheet package, ranging from storing data in lists to complicated accounting pro-26- cedures. The main limitation on all home computers is the amount of available RAM to store the input information. In addition to the memory consumed by the program, most of the spreadsheet programs require that all of the data be in memory all of the time. Even with the efficiency of storing data in a compact format, it doesn't take a very great number of columns and rows to deplete a 64K machine. (One new program, Multiplan, implements a "virtual memory" system which allows spreadsheet data to be as large as available disk space by swapping into and out of memory, the sections of the data currently being used. This explains all of the interest in additional RAM cards to increase the available RAM to 128K or more. Some spreadsheets allow up to 512K of additional memory.

Very specific applications that can be expected to remain unchanged, such as maintaining a checkbook, are probably handled more easily with a dedicated program. A spreadsheet is very useful for applications that change often, being easily modifiable, and with instantaneous feedback as to the correctness of the calculations. Some applications, such as your income tax, change with each use. A spreadsheet set up to calculate your Form 1040 could be easily modified each year to account for changes in the form by the IRS. A dedicated program designed for a particular year would have to be rewritten each subsequent year.

Small database applications — for instance, lists of names, addresses and telephone numbers — can be easily maintained and sorted (only newer products have automatic sorting capability) by zip, last name, etc.

The ability to see and adjust the screen formatting is also very useful. Printed output for monthly finances, budgets and other reports is quickly generated and the templates can be used again each time a new report is needed.

Anyone connected with a statistically-oriented team (what sport isn't?) can keep records and all the associated stats easily and make updates quickly and effortlessly. Bowling league, Little League and local school teams can benefit from accurate reports generated on a timely basis.

Some Samples of Use

Spreadsheets can be used for tracking expeditures against a proposed budget. Many companies have to allocate an advertising budget amongst several different media and products. It is a simple matter to design an overall budget plan and then juggle figures on the spreadsheet to develop a good mix between emphasized products and target audiences. Recalculation of the budget totals is swift and feedback of the effects of various strategies is essentially, instantaneous.

Bid preparation can be handled well on a spreadsheet. Since pinning down all the expenses is very difficult, and profit margin depends a great deal on the accuracy of the bidding, a tool for juggling the numbers facily is a great

help in maximizing profit. All of the various factors — consulting, labor, equipment, materials and subcontracting — can be charted, with considerable "what – ifing" being done with the figures to arrive at an appropriate idea of expenses. The expected margin of profit can be added with some assurance that the final figures have taken a good deal of the risks involved into consideration.

Many small accounting type problems can be easily solved without resorting to large, unwieldy, fixed-format accounting packages. This is especially true of smaller businessmen who might not want to spend a lot of money for special accounting software that would need to be tailored to their own particular business. A spreadsheet can do multiple checkbooks, prepare invoices and purchase orders, track accounts payable and receiveable, and a multitude of other accounting functions. While none of the "just" spreadsheet programs can match a fully developed accounting system, some of the newer spreadsheets can do most, if not all, of the job.

At MICRO, we use a spreadsheet program for much of our work involving simple accounting procedures and data-base management. It keeps all of our paper work under control and we only have to enter names and addresses one time, with everyone sharing the files for additional uses. For instance, to help with the organization of the advertising department, we have a list of advertisers, such as figure 1, which can include such information, in addition to names and addresses, as account number, advertising pages, page size, page rate, commissions, and sales regions.

From such a master list, it is a simple matter to sort the list monthly by current page size, deleting the accounts that are currently inactive, alphabetizing the remaining accounts for a monthly advertising summary. The next step is to sort the list by region (figure 2) so that each sales representative can see the totals for his region and in comparison to the other regions. We can add magazine page numbers to the list (figure 3) and dump the list to a text file, instead of the printer, and transfer it to the typesetter to compose the advertisers' index without rekeying all the names. (See MICRO 59:54 for furthers details of our typesetting communications.)

A quick look at a work sheet to figure monthly incomeexpenses shows how simple a work sheet template can be, but still have a useful function. With a minimum of effort, each month, a quick summary can be prepared by entering the few necessary figures.

Figure 4 illustrates how formulae are stored in cells. The third column (C) contains the formula for the sum of cells Dn and En where n is the row number. This column is easily filled in by defining the formula in cell C5, and then, using the Replicate command with "relative" values, copying that cell into C6...C78. The formula in C80 is the sum of column C, and that is replicated into D and E. The screen display can show either the calculated values or the actual formulae. This is set from the command line.

This figure is a split example to demonstrate the relationship between formulae in the cells and the values in the cells. The chart was printed out once in formula dump mode and once regularly and then superimposed to give the illusion of the formulae being present with the values.

Record keeping for a team such as baseball or soccer is easily managed on a work sheet (figure 6). Such a list can

easily be sorted by last name for a team roster, by birthdate for eligibilty and yearly updating, by phone numbers for a telephone tree, by zip code for a mailing list or by other factors such as individual game statistics or personal factors.

Other topics that lend themselves to worksheet solving include accounts receiveable ageing, invoicing from inventory, cost recovery, production scheduling, estimating, checkbook ledger, engineering formulae, accounts payable, payroll reporting, monthly sales reporting, daily inventory and financial forecasting.

Advanced Uses

There are additional features to be found on most spreadsheet packages. These are more complicated to use and require a deeper understanding of how a worksheet functions. These include, but are not limited to:

@CHOOSE Returns the value of a particular cell @COL Returns the current column number @COUNT Returns the number of cells in a range @ERROR Returns error message @INDEX Returns value next to match @ISERROR Returns TRUE if ERROR, otherwise FALSE Returns TRUE if NA, otherwise FALSE @ISNA @LOOKUP Returns value less than or equal to match @NA Returns NOT AVAILABLE error @ROW Returns the current row number

The @CHOOSE function is useful for selecting a value from a pre-determined list. It is similar to @LOOKUP, except that the table does not have to be defined in the worksheet proper. For instance, if you knew that in Trial 1 you wanted to use an interest rate of 11.5%, in Trial 2 you would use 13.5%, and in Trial 3 you would use 17.875%, by defining cell C4 to contain the particular number of the trial you are running, the following formula can be used anywhere in the sheet to substitute for the appropriate interest rate:

@CHOOSE(C4,.115,.135,.17875)

When cell C4 contains a 1, the value returned is .115, if it has a 2, then the values is .135, and if it has a 3, the value is .17875.

The @COL function is useful for indexing items that ascend by increments of one, such as dates. The value for column A is 1, B is 2 and so on. If you replicate a formula such as

1982 + @COL

across the top of the worksheet, you will quickly generate a yearly sequence.

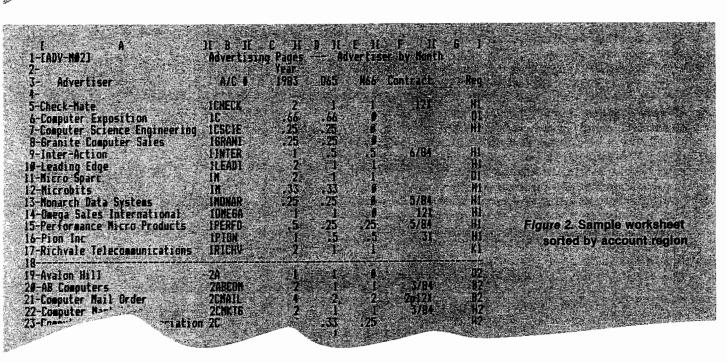

The @ROW function is useful for indexing items that ascend by increments of one, such as counters. The value for row 1 is 1, 2 is 2 and so on. If you replicate a formula such as

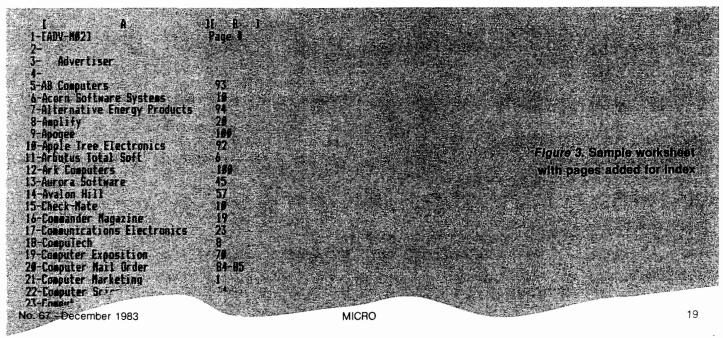

@ROW-6

down the side of the worksheet starting in row 7, you will quickly generate a numbered list.

The @COUNT function is useful for determining n, the number of items used in calculating a particular formula. Such a determination is necessary in many statistical analyses, such as NPV or STDDEV. @COUNT includes only values in the specified range, it does not

count labels or blanks. You can specify a list, range or list of ranges in the argument.

The @LOOKUP function is very useful to read elements of a table included in the worksheet. Suppose a software package had the following price based on quantity:

Quantity Price/Package 100 22.95 300 17.95 500 14.95 800 11.95 000 9.95

This would be entered in the worksheet in two adjacent columns, say D and E. The price per document can be entered anywhere in the worksheet by the formula:

@LOOKUP(B2,D1...D5)

The @LOOKUP function would determine the quantity ordered from cell B2, say 650, and then skim through the D1...D5 column looking for a value larger than the current value. When it finds one, in this case at D4, it then backs up one entry and reads the value in the next adjacent column, here 14.95 (from E3), and returns with this value. It is also possible to specify the range to be searched as a row, and the value will be taken from the row below the searched row.

The @INDEX function is the same as the @LOOKUP function [cf.], except that an exact match is required.

The @ERROR function is used in several different ways. @ERROR displays the word "ERROR" in the current cell, and in any cells with formula references to that cell. It can be used in tables with CHOOSE, INDEX or LOOKUP formulae to screen out invalid table entries. It can also be used in combination with an @IF statement to exclude certain values from an acceptable range. For instance, if you wanted to sum a range of numbers only if Al was in the range of 50-100, then the following formula could be used:

@IF(@AND(A1.. = $5 \cup A1.. = 100$), @SUM[B1...B20], @ERROR)

This would check the value of A1 before evaluating the formula and would return "ERROR" if the value was outside the specified range.

The @NA function is used for template generating. All of the cells which require entered data are first flagged with @NA. Later, after the data has been entered, a simple test can be used to check to see if all the cells have been updated.

The @ISERROR function tests any type of argument and returns TRUE if the argument is an ERROR condition, false if it is not an ERROR. This is a good way to test whether one or more calculations has produced an error:

@IF(@ISERROR(A3),0,A3*B5)

The @ISNA function tests any type of argument and returns TRUE if the argument is a NOT AVAILABLE condition, false if it is available. This is a good way of making calculations conditional on the availability of data:

@IF(@ISNA(A3),@NA,A3*B5)

Some fairly complicated worksheets can be developed using these advanced features.

Memory Considerations

The particular spreadsheet that we use is a Flex-based

system called *Dynacalc*. Since that is the system that I am most familiar with, I will describe some of the working techniques of that system, assuming that all work-sheet programs must use an overall somewhat similar system, while perhaps differing on some of the fine points.

This program allows 256 columns and 256 rows, not both at once, as it would require 128K bytes just to address all of the cells. A cell table is set up with a two-byte address for each cell in use (sometimes not in use, as we shall see). The cell table can hold 7680 entries, which means that you can address to cell AD256, for a tall worksheet with many rows, or to cell IV30, for a long worksheet with many columns, or any combination in-between, as long as the total figure ROW*COL doesn't exceed 7680.

Each entry in the cell table requires a two byte address. If you GOTO cell AD256 and enter a single character, you will have consumed 15360 bytes for cell addresses and one byte for the label. The program allocates all cells horizontally and vertically up to the largest address in use. However, it doesn't subtract cells from the table ever. If you have overflowed memory and deleted several rows, you won't get the full benefit of extra memory until you /S SAVE the file and /S LOAD the file back into the system after /Clearing the workspace. When the file is read back into memory, the unused rows and/or columns will not be allocated in the cell table with the resultant saving in memory.

Each value uses 10 bytes of memory, even "0". A cell reference in another cell also uses 10 bytes. Placing a B1 in cell A2 uses 10 bytes of memory. Labels use only one byte per character. Therefore, if you have a numerical sequence of labels "1", "2", "3" ..., it is much more memory efficient to enter them with a leading ' [single quote] to assure that the worksheet considers them to be a label.

A calculation (@SUM(A1...etc.)) starts at 10 bytes and consumes additional memory depending upon how long the calculation is. Therfore, if you are running out of room, it will save space to put an often used calculation in one cell, and reference it from other cells. If you are really desperate for a few extra bytes, replacing a formula by its value will also save space, at the expense of recalculation time, if any of the values in the formula change. You would have to re-enter the formula to recalculate the results (or do it by hand).

Visual display

Stop me if you've heard this one before — you really need 80 columns to be able to see a reasonable portion of the worksheet. Some of the new video boards [for Apple anyway] allow a display of 132 columns on-screen. The more you can see, the easier and faster it is to work with the program. The less scrolling that you have to do, the better. I use the GOTO cell command a lot because it is much faster than scrolling row by row or column by column to the desired site. I often add 20 to the desired cell number so that the cell is located in the upper portion of the screen when I get there.

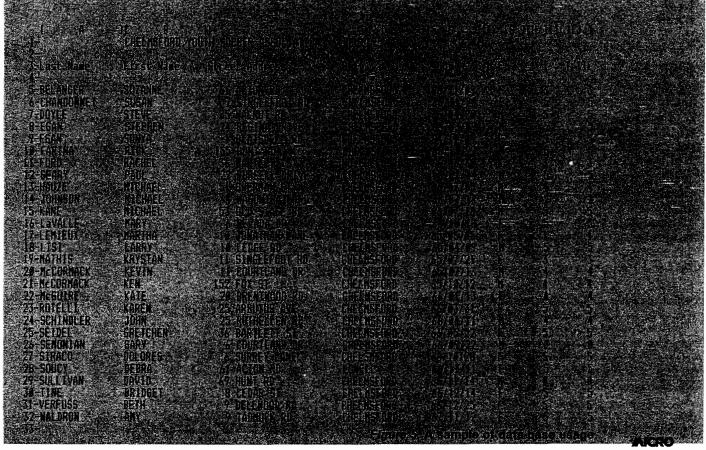

When in the formula dump mode (formulae displayed on the screen instead of values), the formula is only printed to the width of the column. Often, this is not wide enough to see the whole formula on the screen, or printer. To enable printing of the whole formula, it is necessary to widen the columns containing the formulae somewhat. This is only necessary for dumping the formulae to a

printer. I often put the printer into compressed mode, to get the greatest number of columns on the paper at once. With a 15 inch carriage, you can print about 230 characters across.

I don't know how I functioned B.S. (that's before spreadsheets). I would recommend just about anyone who

owns a computer to try out **MICROCalc** (elsewhere in this issue), and if you really need the power and memory of a full-size spreadsheet, buy one of the many software packages available. A list of the spreadsheets available for the computers we normally cover is listed at the end of this article. Happy calculating!

SANYO MONITOR SALE!!

9" Data Monitor

- 80 Columns × 24 lines
- Green text display
- East to read no eye strain
- Up front brightness control
- High resolution graphics
- Quick start no preheating
- Regulated power supply
- Attractive metal cabinet
- UL and FCC approved

• 15 Day Free Trial - 90 Day Immediate Replacement Warranty

9" Screen - Green Text Display

\$ 79.00

12" Screen - Green Text Display (anti-reflective screen)

\$ 99.00

12" Screen - Amber Text Display (anti-reflective screen)

\$119.00

14" Screen - Color Monitor (national brand)

\$249.00

Display Monitors From Sanyo

With the need for computing power growing every day, Sanyo has stepped in to meet the demand with a whole new line of low cost, high quality data monitors. Designed for commercial and personal computer use. All models come with an array of features, including upfront brightness and contrast controls. The capacity 5×7 dot characters as the input is 24 lines of characters with up to 80 characters per line.

Equally important, all are built with Sanyo's commitment to technological excellence. In the world of Audio/Video, Sanyo is synonymous with reliability and performance. And Sanyo quality is reflected in our reputation. Unlike some suppliers, Sanyo designs, manufactures and tests virtually all the parts that go into our products, from cameras to stereos. That's an assurance not everybody can give you!

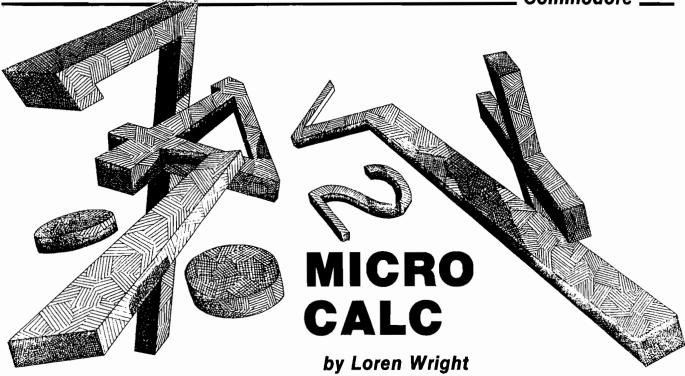

• LOWEST PRICES • 15 DAY FREE TRIAL • 90 DAY FREE REPLACEMENT WARRANTY
• BEST SERVICE IN U.S.A. • ONE DAY EXPRESS MAIL • OVER 500 PROGRAMS • FREE CATALOGS

Add \$10.00 for shipping, handling and insurance. Illinois residents please add 6% tax. Add \$20.00 for CANADA, PUERTO RICO, HAWAII orders. WE DO NOT EXPORT TO OTHER COUNTRIES.

Enclose Cashiers Check, Money Order or Personal Check. Allow 14 days for delivery, 2 to 7 days for phone orders, 1 day express mail! Canada orders must be in U.S. dollars. Visa - MasterCard - C.O.D.

Typing in the Listing

or all Commodore computers you will be typing in all or part of listing 1, the version for the Commodore 64. If you are using a PET or a VIC-20, you should skip the lines marked. There are different versions of these lines in listing 2 (for the VIC-20) and listing 3 for the PET. The features for the PET and Commodore 64 versions are the same:

- ✓ support of disk or tape files
- ✓ optional zeroing of user variables
- multiple statement support
- ✓ display of disk file name

The VIC-20 version has the following features

- ✓ 10 working lines
- ✓ support of tape files
- optional zeroing of user variables
- multiple statement support

Operating Instructions

Commodore 64

F7 performs calculation
F8 zeros user variables
left arrow enters file mode
British pound vic-20

The VIC-20 version operates the same as the Commodore 64 version, except there is no comment field, so the British pound key has no function.

See the comments in the main arti-

cle (page 11) for hints on how to get more onto the VIC's smaller screen. Predefined constants and functions will be particularly useful.

PET

Since the PET has no function keys, these have been replaced:

performs calculation
 zeros user variables
 left arrow
 backslash
 enters file mode
 enters comment field

Using the Internal Timer

Commodore computers have a special variable TI, which increments once every 1/60 second. You can use this timer on a Micro Calc screen to compare the speed of BASIC functions. Following is a screen that demonstrates how to do this:

A = 5.3507 T = TI $B = A \uparrow 2$ U = TI - T U? T = TI $B = A \cdot A$ U = TI - TU?

You may be surprised by the results of this comparison between using exponentiation and simple multiplication to square a number. Other comparisons you may wish to try are:

using a number vs. a variable in a calculation

the SQR() function vs. raising to the .5 power SIN() vs. COS()

How to Use the RND() Function

The RND() function on Commodore computers is actually a pseudorandom number generator. This is because each successive random number depends to some extent on the previous number. On VIC, C-64, and later PET models, the random number generator works as follows:

A negative argument reseeds the random number generator with a number calculated from the argument. If you use the same argument each time, you will generate the same sequence of random numbers. Use a negative argument only once to start a sequence. Then follow with positive arguments.

A positive argument will generate a new number in the sequence, without reseeding the generator.

A zero argument yields a random number that is not based on the seed.

To get the most closely random sequence, you should either use RND(0), or start by performing RND(-TI) and then follow with RND(-TI) using a positive argument.

To get random integers the following calculation should be used:

R = 10 N = INT(R*RND(0) + 1)

This gives random numbers N from 1 to R. If you leave the +1 out, you'll get numbers in the range 0 to R-1.

Comments on Commodore listings

Starting this month, our Commodore listings are being output on the EPSON FX-80 printer. This printer allows redefining some or all of the Epson ROM character set. After much testing, we arrived at a compromise set of characters. Since many of the reversed characters would be difficult to read at the size of these listings, we thought that it would be clearer for the reader typing these programs into his computer to underline the reversed characters. The Commodore programs that follow utilize this new style of listing. If anyone has any comments, proor con, drop us a line with your viewpoint.

Comments on VIC and Pet listings

The C-64 listing is the complete MICROCalc listing if you have a VIC, Expanded VIC of PET then the listings are not complete. For VIC and PET, you must use the C-64 listing from lines 4000-7999, an Expanded VIC has additional changes to the standard VIC program.

Listing 2 VIC-20

CLOCK CIA CIA CIA

8:30:58.9

By Ian Adam

This article shows how to use the extremely accurate time-of-day clock built into the Commodore 64's CIA chip. The demonstration includes an alarm clock that runs independently of most other programs and I/O function.

he Commodore 64 does an acceptable job of keeping time with its TI\$ clock. All you have to do is set TI\$ to the current time, and it will run as long as the computer remains on. You can use the C-64 for just about anything else and just type ?TI\$ when you want the time.

However, there are several limitations on use of the built-in time function. First of all, it is not very convenient to use while a program is running. You have to STOP the program, carefully ask the time (no syntax error, or else...), then CONTinue with the program. Second, the TI\$ function is not very accurate. A recent sample of a half dozen computers gave a typical error of 2.2%. That's over one minute per hour, or 32 minutes per day! Good enough to keep track of whether it's light or dark outside, perhaps, but not adequate to launch the space shuttle. The TI\$ clock also stops, running when a file or program is being loaded or saved. And third, of course, it's only there when you ask, and we all know how easy that is to forget!

But despair not; a ready solution is at hand. In fact, your 64 contains not one, but three clocks [count 'em!]. The additional timepieces are contained in the two 6526 Complex Interface Adapter chips (CIA's), and they offer some considerable advantages. These two chips are provided by Commodore for the purpose of carrying out a multitude of housekeeping functions, such as generating interrupts, reading the keyboard and joysticks, external communications, etc. The two clocks are a bonus. And very accurate, too ...

they include tenths of seconds, and appear to be that accurate over the course of a day. They also keep running during input/output operations, in fact anytime the computer is turned on. With two clocks, you could keep track of the time in Mandalay, if you want, and there are even programmable alarms so you won't miss dinner there either!

Using the Program

Type in the listing as shown; type the DATA statements carefully, since they contain the machine language program. Any error in that portion can crash the computer.

When you've finished typing, SAVE a copy of the program before you run it. This will avoid having to retype the whole thing in the event of a fatal typographical error. Then go ahead and RUN it. First, the program will READ the machine language DATA and store it in memory. The variable CH is a checksum to guard against errors in the data. If the program stops and indicates a data error, then double-check everything. Assuming that is ok, the program will then ask you to enter the correct time. Give the AM/PM and the hour, when asked for the minute. check an accurate time source, and type in the number of the next minute (e.g. if it's 8:30, type in 31), then wait until that minute arrives to press "RETURN". Pressing return starts the clock.

After the instructions, you will be prompted for the time you want the alarm to be set to. When the alarm time matches the clock time, it will be announced by:

-the border of the screen flashing;

-a buzzing sound; and,

-the word "ALARM" flashing above the time.

If that isn't enough to attract your attention, then perhaps you're in a time warp! In any event, you can turn off this display simple by pressing the "F1" key.

When properly loaded, the program will run just like clockwork. It will supply you with the instructions, but for your reference I'll repeat them here:

(equals) 0 to 15;

SYS 832: recall time display to

screen;

SYS 994: turn off time display (still

runs internally):

POKE 982,n: change color, where n

(equals) 0 to 15;

GOSUB 9140: set or reset alarm time;

stop alarm display.

As before, the operating part of the program is in subroutine form, so you can include it in other programs as you wish. The commands listed above can also be used within a program, once the time is correctly set. To stop the alarm display under program control, just use POKE 197.4.

If the F1 key is not convenient for stopping the alarm, for example if your program uses it for some other purpose, then it can be changed: it's the value that appears in memory location 197 when the key is pressed.

The main program is stored in the cassette buffer, while the alarm portion occupies an unused area of page 2 memory as well. Thus, they may conflict with other programs that use these areas for machine language or sprites. The program would also be destroyed by any tape load or save activities. If these cautions create a problem, then the routine should be relocated to a different area of memory. This is a straightforward task, but does require a basic knowledge of machine language. For those who want to study the machine code, an assembly listing is provided (listing 2).

Technical Details

The CIA clocks are a little more difficult to access than TI\$; with this program, however, it's as easy as apple pie. The time is contained in four registers for hours, minutes, seconds, and tenths (locations 56331 to 56328 for chip A, and 56587 to 56584 for chip B). To avoid having the time flip over while reading the clock, all four registers are frozen whenever the hours register is read or written to. The clocks continue to keep good time while this is in progress. The last step in any access should be a read or write to the tenthsof-seconds register, to "unfreeze" the clock.

Each register stores its data in binary-coded decimal, or BCD, format. The hours register also contains an AM/PM indicator in bit 7. This would be an ideal format if the chip were running a display such as a digital alarm clock directly. For use in the computer, however, it does require some coding and decoding. This is a little awkward but not too difficult in BASIC, and even simpler in machine language. Once set, the clocks will automatically keep track of the time and AM/PM for as long as the machine is on, or until they are reset.

So how do we set the alarm? By exactly the same process as setting the time... by poking values into the same four registers! Only difference is, we first have to set bit 7 of the control register to a one. This signals to the chip that we want to set the alarm time instead of the clock time. The multiple use of these registers does keep things simple-honest! Lines 9160 and 9170 of the program take care of the BCD conversion. Line 9175 sets the control register to its normal value.

Once the alarm has been set, it cannot be read. When the prescribed time is reached, this is signalled by setting bit 2 of the interrupt register. The program must recognize this, and proceed

to alarm the operator in whatever way is specified. Don't worry, it won't bite. All of this may sound complicated, but the program takes care of the details.

These are the main registers involved:

Function Chip A Chip B	
	i v
	1,270
Hours & AM/PM 56331 (\$DC0B) 56587 (\$DD0B)	
Minutes 56330 (\$DC0A) 56586 (\$DD0A)	
Seconds 56329 [\$DC09] 56585 [\$DD09]	
Tenths 56328 (\$DC08) 56584 (\$DD08)	图 数
	200
Interrupt 56333 (\$DC0D) 56589 (\$DD0D)	
Alarm Control 56336 (\$DC0F) 56591 (\$DD0F)	

A Quirk In The Chip

Help; there's a quirk on the loose!

In programming the alarm, I came upon a most unusual feature. I got the alarm all set up, and (after a lot of hitand-miss changes| finally got it to work well. Eureka. The only trouble was, the alarm would mysteriously sound for a second time, exactly one minute later. Really had me stumped for a while. After a sleepless night, however, it came to me what the problem was. Say the alarm is set for 8:30:00.0, and sounds at that time. One minute later, at precisely 8:30:59.9, the tenths-of-asecond register rolls over, giving an instantaneous time reading of 8:31:00.0, but it is apparently sufficient to trigger a second alarm (sometimes).

There are three or four ways to program around this quirk, once you know it exists. I decided the easiest way to solve the problem would be to POKE a 1 into the tenths register (i.e. setting the alarm time in our example to 8:30:00.1). This removes the alarm from the vicinity of the rollover, and seems to have banished the quirk to another world. If it should ever return to haunt you, please let me know; maybe we'll try an exorcist.

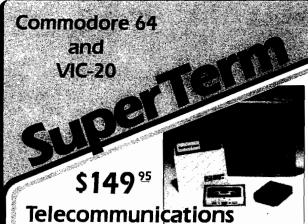

You may contact Ian Adam at 3706 West 20th Ave., Vancouver BC, V6S1E8 Canada.

with a difference!

Unexcelled communications power and compatibility, especially for professionals and serious computer users. Look us over; **SuperTerm** isn't just "another" terminal program. Like our famous Terminal-40, it's the one others will be judged by.

- EMULATION—Most popular terminal protocols: cursor addressing, clear, home, etc.
- EDITING—Full-screen editing of Receive Buffer
- UP/DOWNLOAD FORMATS—CBM, Xon-Xoff, ACK-NAK, CompuServe, etc.
- FLEXIBILITY Select baud, duplex, parity, stopbits, etc. Even work off-line, then upload to system!
- DISPLAY MODES—40 column; 80/132 with side-scrolling
- FUNCTION KEYS—8 standard, 52 user-defined
- BUFFERS—Receive, Transmit, Program, and Screen
- PRINTING—Continuous printing with Smart ASCII interface and parallel printer; buffered printing otherwise
- DISK SUPPORT Directory, Copy, Rename, Scratch

Program options are selected by menus and function keys. For maximum convenience, an EXEC file sets all options on start-up. SuperTerm may be backed-up for safety. Software on disk with special cartridge module.

Write for the full story on SuperTerm; or, if you already want that difference, order today!

Requires: Commodore 64 or VIC-20, disk drive or Datasette, and compatible modem. VIC version requires 16K memory expansion. Please specify VIC or 64 when ordering.

Smart ASCII Plus . . . \$59¹⁵

The only interface which supports streaming $\,\,\,$ —sending characters simultaneously to the screen and printer $\,\,\,$ — with SuperTerm.

Also great for use with your own programs or most application programs, i.e., word processors. **Print modes:** CBM Graphics, TRANSLATE, DaisyTRANSLATE, CBM/True ASCII, and PIPELINE.

Complete with printer cable and manual. On disk or cassette.

VIC 20 and Commodore 64 are trademarks of Commodore Electronics, Ltd.

Commodore Compass

by Loren Wright

Low-cost Word Processing for C-64

ommodore has been bringing out a great deal of software for the Commodore 64 lately. Most of it is very good and most of it is priced less than competing products. Easy Script is no exception.

It is very much like Steve Punter's Word Pro 3 Plus/64 (sold by Professional Software and Pro-Line and reviewed earlier in this column). In fact, the overall design and command syntax are nearly identical. There are several differences, and most of them work in favor of Easy Script.

Like Word Pro 3 Plus/64 (which I hereafter refer to as simply Word Pro), Easy Script uses a wordstream format, which results in words being split across the end of a screen line. Screens of the two word processors look very similar. Easy Script's is a bit easier to follow because the cursor flashes and because line endings and format chracters appear in reverse field. Easy Script allows you to set a working screen width of up to 80 characters. This makes working with tabular and indented material much easier, but typing on this wider screen is not very convenient due to the necessary panning across the 40-column screen. There is also an output-to-video function (lacking in the C-64 version of Word Pro), which allows you to see what your document looks like before you print it out. While viewing the video output you can select any page or pages for printing out. With Word Pro you get all or nothing.

Easy Script can be used with either cassette or disk, but not both at the same time. Editing is more convenient, particularly since there are true block-delete, -transfer, and -copy commands. Word Pro only allows these operations on whole screen lines. There is also a major difference in the files produced by the two word processors. Word Pro produces program files, while Easy Script produces sequential files. Sequential files are more accessible

from other programs, including your own BASIC programs. Easy Script allows considerably more text in memory at one time — 764 lines vs. 329. It is also possible to save only part of the text in memory to a disk file.

Easy Script lacks the "extra text" feature of Word Pro, but at least one use of it is taken care of: Easy Script makes it possible to get a disk directory without wiping out text in memory. Another use of extra text is not duplicated. Easy Script has no "append characters" or "append text" features. With Word Pro it is possible to label a number of frequently used phrases or text segments in extra text and call them into main text with a few keystrokes.

Word Pro was once the best word processor available for Commodore machines. It can no longer claim that honor. As each new Commodore machine has come out, a new version of Word Pro has become available, but instead of taking advantage of the features of the machine, only enough changes to get it running have been made. Easy Script is a better word processor, and, according to Jim Strasma and a number of others, Paper Clip from Batteries Included is also better. Easy Script is especially attractive because of its price. Commodore won't quote a suggested retail price, but \$50 is a good guess.

The Complete Personal Accountant

Since I am now completely selfemployed, I suddenly need to keep much better financial records. I was intrigued by Jim Strasma's number one rating for Complete Personal Accountant in last month's Commodore Buyer's Guide, so I obtained a copy with the idea of reviewing it here. I now have a good start on getting my finances in order!

Formerly called *The Color Accountant*, *Complete Personal Accountant* is actually a set of programs that work

together in various ways. The heart of the package is the Chart of Accounts, which operates with the Checkbook Maintenance, Financial Statements, and Budget Analysis programs. Setting up is a little involved, but extra time spent in set-up is rewarded in time saved in maintaining your records. The first order of business is to set up your chart of accounts. There is a standard chart provided, but you will surely want to make changes, additions, and deletions. Accounts in the chart are divided into assets, income, liabilities, equity, and expense accounts. There is room for 99 different accounts, with up to 9 subcategories in each, up to a total of 300 subcategories. Next, you go through your checkbook, check by check and deposit by deposit. As you enter each item, you decide what account to credit or debit. Each check and deposit is automatically entered on the disk file. When you're done, not only have you balanced your checkbook, but you have also recorded your expenditures in the different accounts. There is provision for more than one checking account, although these files must be stored on separate disks, and you may indicate some payments to take place automatically. There is a great deal of support for error checking and for making backup copies of your disks.

When you have your checkbook balanced, you can then proceed to generating financial statements or to budget analysis. Other capabilities of these programs include generating checks from your computer, graphing results in color on the screen or on a VIC printer, and checkbook search. The other programs, which don't work with the ones mentioned above, include a Payments Calendar, Appointments Calendar, and Mailing List.

I had a little trouble figuring out when a debit subtracts from and when it adds to an account. An appendix in the excellent manual explains these terms — I wish I had read it before I started entering checks! Complete Personal Accountant is available from Programmer's Institute for \$79.95. The cassette version is \$74.95, and the package has been divided into three parts for about \$30 each.

Getting Started in Machine Language

There are several things you can do with your VIC or C-64 in machine

language that you can't do in BASIC, minimal monitor included with computers have built-in machine nearly free. language monitors, while less expen-Atari, Color Computer, VIC, and Commodore 64 do not. A monitor is a program that lets you look at and modify the contents of memory locations and *Programming*. processor registers, and load and save ranges of memory. An extended monitor is one that adds extra functions, such as a disassembler, a miniassembler, and trace and break-point capability. Monitors are available on MON, and TINYMON. There is also a editor for source files. It is quite a bit

and there are many things that can be Richvale Telecommunication's V-Link done faster. For instance, using BASIC and 64-Link cartridges. VICMON and to clear the high resolution screen is a 64MON are cartridges available from very slow process that takes a fraction Commodore; HESMON is available on of a second in machine language, and cartridge for both machines from raster interrupt programming is vir- Human Engineered Software; and the tually impossible in BASIC. As the others are disk or cassette-based computer comes, though, there is little monitors available as listings in that you can do beyond simple pro- magazines or from user's groups. One grams that you POKE in from DATA of the commercial cartridges will statements. Larger and more expensive cost \$40-\$50. The others are free or

You should also have a copy of the sive, smaller computers, including Programmer's Reference Guide for your computer and a good general 6502 programming book, such as Lance Laventhal's 6502 Assembly Language

The next step is to get a full-fledged assembler. This will cost about \$100. I have been using PAL (by Brad Templeton, sold by Pro-Line Software and find it especially convenient because it's designed to work with cartridge, disk, or cassette. Some of the POWER, which I reviewed here earlier. better known monitors for Commodore PAL does not have macros or condimachines are VICMON, 64MON, tional assembly, but it has several ad-HESMON, SUPERMON, MICRO- vantages, such as using the BASIC

smaller than others and is relatively position-independent. MAE, from Eastern House Software, is a fullfeatured assembler that is well supported. It is still the only assembler available for all the major 6502 machines. I have used versions for the PET since the beginning. Commodore's assembler is also an excellent package that includes macros and conditional assembly. There are other programs beyond the assembler, such as Pterodactyl's PTD 6502/6510 Debugger, but they are for pretty serious programming.

If you are at all serious about learning about computers, you owe it to yourself to explore machine language. Many things will suddenly become much clearer. You may not end up doing a lot of assembly language programming, but just the exercise will be rewarding.

MICRO"

C64-FORTH for the Commodore 64

FORTH SOFTWARE FOR THE COMMODORE 64

- C64-FORTH (TM) for the Commodore 64 \$99.95
- Fig Forth-79 implementation with extensions Full feature screen editor and macro assembler
- Trace feature for easy debugging
- 320x200, 2 color bit mapped graphics
- 16 color sprite and character graphics
- Compatible with VIC peripherals including disks, data set, modem, printer and cartridges
- Extensive 144 page manual with examples and application screens
 "SAVETURNKEY" normally allows application program distribution without licensing or royalties

C64-XTEND (TM) FORTH Extension for C64-FORTH - \$59.95 (Requires original C64-FORTH copy)

- Fully compatible floating point package including arithmetic,
- relational, logical and transcendental functions
- Floating point range of 1E+38 to 2E-39
- String extensions including LEFT\$, RIGHT\$, and MID\$
- BCD functions for 10 digit numbers including multiply, divide, and percentage. BCD numbers may by used for DOLLAR.CENTS calculations without the round-off error inherent in BASIC real numbers.
- Special words are provided for inputting and outputting DOLLAR.CENTS values
- Detailed manual with examples and applications screens

(Commodore 64 is a trademark of Commodore)

- TO ORDER Specify disk or cassette version
 - Check, money order, bank card, COD's add \$1.50
 - Add \$4.00 postage and handling in USA and Canada
 - Mass. orders add 5% sales tax
 - Foreign orders add 20% shipping and handling
 - Dealer inquiries welcome

IAICRO[™] Commodore Reviews

Product Name: SYSRES

Equip. req'd:

Commodore 64 and 1541 disk drive

Price:

Manufacturer:

Solidus International Corp. 1060 Roosevelt Crescent North Vancouver, BC Canada, V7P 1M3

(604)984-0477

Description: Systes is supplied on a single 5 14" disk. It extends and enhances the C-64 operating system. Originally developed for the PET, Sysres adds 33 new commands to BASIC and includes 11 DIS-support commands. The added commands rovide such features as renumbering a program, search and replace, auto-line numbering, forward and backward scrolling through a listing, and many more. Some of these new commands function in different ways, depending upon the options selected, so that altogether over one thousand new functions are added. Sysres will function with an IEEE-488 adaptor, gaining access to larger, faster CBM dual disk drives and printers. It also supports non-CBM, ASCII printers.

Pluses: Although the number of features available is large, the syntax is clear and logical - quite easily mastered. Also notable is the fact that Sysres code is "hidden" — using almost none of the available program space. It can be booted without disturbing the resident BASIC program. From end-to-end Sysres appears to be well thought out and professionally implemented. In the "programmers aid" category Sysres is definitely a Cadillac. Note that programs written using Sysres do not need Sysres to run later.

Minuses: The system is supplied on a Master diskette that is copy protected. It cannot be backed up. However, Solidus guarantees replacement free of charge within 90 days of purchase, and replacement for \$10.00 thereafter.

Skill level required: This product is targeted for the serious programmer. However, it's logical, easily learned syntax should make it useful for anyone with even modest proficiency in BASIC.

Documentation: The Sysres master disk is accompanied by a 112 page user's guide in the form of a 3-ring hard-(Continued on next page)

What's Where in the Apple A Complete Guide to the Apple Computer

This Revised Edition of the famous Apple Atlas provides Apple computerists with a framework for understanding both the overall structure of the Apple system and programming techniques that exploit that knowledge.

What's Where in the Apple contains the most complete memory map ever published as well as detailed information needed for actual programming.

> All for only \$24.95 (plus \$5.00 s/h)

MICRO makes it easy to order. Send check (payable to MICRO) to:

For owners of the original edition, MICRO is offering a companion book, THE GUIDE to What's Where in the Apple, for only \$9.95 (plus \$2.00 s/h).

THE GUIDE contains all new material that explains and demonstrates how to use the Atlas and Gazetteer published in the original volume of What's Where in the Apple?

backed, loose-leaf notebook. However, it is very good in the description of the syntax and use of Sysres. Each command is fully explained and examples are given.

Reviewer: Roger Crites

Product Name: Smart Ascii

Equip. req'd: Commodore VIC-20 or '64 any memory

configuration

\$59.95

Manufacturer: Midwest Micro Associates

P.O. Box 6148

Kansas City, MO 64110

Description: Smart Ascii is a software/hardware package that interfaces the Commodore VIC-20 or '64 to any parallel printer using the "Centronics standard" protocol. The package consists of a cassette tape containing the software interface (there are separate versions for the VIC and '64, both on the same tape), and a three foot cable for connecting the computer to the printer via the user port.

Pluses: Smart Ascii is very easy to install and responds to the same type of commands as the VIC printer (OPEN, CMD, PRINT#). It has three very useful printing options: TRANSLATE translates selected control characters into a character string (reverse on becomes "(RVS)", etc.). "CBM" ASCII prints all uppercase, for program listings. "TRUE" ASCII prints upper and lowercase for word processing applications. The software is not protected and may be backed up to cassette or disk.

Minuses: The supplied cable is only three feet long. The software disables the RESTORE key, which makes life a little difficult if a program ends or is stopped with any of the screen or sound registers not reset.

Documentation: The documentation is very complete and clear. It is well organized, and includes a table of contents. A minor complaint is that the information concerning linefeed conventions and printer control codes, both of which are essential to proper operation of the printer, are hidden in the section labelled "Advanced Programmer Tips".

Skill level required: Minimal. Some knowledge of the printer being used may be required to set the linefeed convention correctly.

1-89-\$29.95

"Hands-on Preview" disk-\$9.95

Manufacturer: Sterling Swift Publishing Co.

> 7901 South IH-35 Austin, TX 78744 (512)282-6840

Description: An educational set of 89 lessons and programs that may be used with children from the third grade on. The lessons cover mathematics from reading and writing two to seven digit whole numbers through equation solving and hit almost everything in between. The package is formatted for use by teachers in the classroom. Each lesson is backed up with worksheets which may be reproduced for classroom use by the students. The worksheets are broken up into pre-test, sample problem. problem, and post-test to allow use as needed to reinforce the learning process.

Pluses: The lessons are well done. In fact this is one of the best teaching packages I have worked with. When the problems re answered correctly the success is congratulated by terms such as: very good, fabulous, etc.. When a wrong answer is given, it is simply stated without any chastisement. At the end of each lesson, if more than 40% of the answers were given wrong, the program suggests that a review might help.

Minuses: The program were evidently translated from PET versions and do not made good use of the color, graphics and sound available from the Commodore 64.

Documentation: As the programs with their worksheets are self explanatory, not much addition documentation is needed or supplied. It tells how to use the programs and suggests methods for obtaining the best learning results from children whose needs vary.

Skill level required: The program set is made to be used in a learning environment. This does not limit them to teacher use only as a parent could make good use of them at home to help the children develop their skills in mathematics. Almost no specific computer knowledge is required.

Commodore:

code. The language itself is extremely fast. It almost equals assembly language in its speed of operation. It is an excellent medium to write games in due to the speed of operation. Once learned, FORTH is much easier to write than assembly or machine language.

Minuses: The program does not come with sufficient information to start using it if you are not already familiar with the language. A disadvantage to someone who is used to using FORTH on another computer is the fact that it is supplied in a cartridge rather than on disk. Other implementations which I am familiar with are disk based. The manual does say that it is not a textbook on FORTH and supplies a list of reference material to help get you started.

Documentation: The 34 page User's guide & Reference Manual is broken into three parts. The first portion explains FORTH differences. The second and largest section contains a glossary of the words in C-64 FORTH while the third section explains how to get C-64 FORTH to work with FORTH-79 standard code. If you know something about FORTH or are willing to learn outside of the provided information, you will find that it is a good implementation. The manual, within the above limitations, presents the information clearly.

Skill level required: User who has progressed beyond the beginner stage.

Reviewer: Richard E. DeVore

Product Name: Passive Solar Design Program for Home

Owners

Equip. req'd: Commodore 64 with 1541 disk drive or

Dattasette

Price: \$99.95

Manufacturer: Don Danvlyk

1538 Ohio Ave.

Virginia Beach, VA 23454

(804)425-7792

Description: A solar design program for the Commodore 64 that helps determine the effectiveness of your design. The program will help design add-ion greenhouses or direct solar-gain passive structures. The choices are: a solar addition without heat storage; an addition with uninsulated heat storage; an addition with well insulated heat storage; and an addition using direct solar gain.

Pluses: The program gives a full financial breakout for each of your designs if desired. It also states whether or not the design is economically feasible. It does this through comparing heat savings to project cost and heat savings to interest that could have gotten from the same investment. Minuses: The computations are approximate rather than actual. If you want to change a dimension while inputting your design, the program takes you back to the menu.

Documentation: Almost non-existent. The saving grace is that after trying the program several times, you won't need documentation.

Skill level required: Could be used by a beginning computerist.

Reviewer: Richard E. DeVore

MICRO

HOW MUCH LONGER WILL YOU LAST?

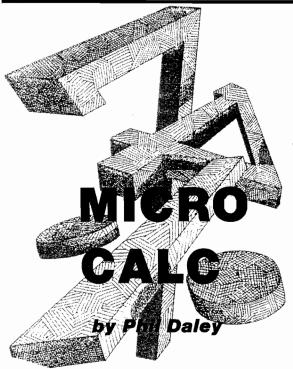

How long can you endure? When will it end?... We're not talking about a new shoot 'em up game for the Commodore 64, but Commodore's own disk operating system! Commodore made a great computer in the 64 but left its disk operating system out in the cold. If you've been waiting for a true disk operating system, here it is!... If you've been waiting for a great BASIC language enhancement that will let you utilize the Commodore's many special features, here it is! What is it? It's grafDOS, the great new utility from Xylex Software that allows the user to actually become friendly with the Commodore 64! grafDOS includes commands like DELETE, RENAME, CATALOG, RUN, etc. The BASIC allows you to do high resolution and low resolution graphics, sound, sprite program, plus much, much more for a total of 40 commands! Plus included in every package is MINIMON, a powerful machine language monitor that includes another 20 commands for use in machine language. The disk also comes with sample programs and demos including a great music generator! And all this together is only \$49.95! How could you have lasted this long without it?

DON'T WAIT ANY LONGER!

Make your programming easier! grafDOS is available now at your local dealer or:

21101 S. Harvard Blvd. Torrance, CA 90501 (213) 328-9422 Visa/MC/Check/Money Order Add \$2.00 shipping CA residents add 6½# sales tax. Dealer inquiries invited.

SCIENTIFIC

Questionnaire Analysis Software

- Microcomputer based
 - Avoid the expense of contract services -- do everything in-house on

Easy data entry
 Avoid time consuming keypunching Uses respondent-marked cards
 entered with an Optical Mark Reader (keyboard entry also possible).

- Comprehensive data analysis
 - Sort on any variable(s), tally all responses, conduct crass tabs, correlations, linear regression, frequency distributions, and more.
- - Weight items, derive composites, add or delete items, and more

Pragrams are user friendly, menu driven, and interactive. No special computer expertise is required.

Call or send for more information today.

APPLE CAT SORT

A Catalog Sorter for the Apple II requires:

Apple II with at least 32K RAM, disk drive with DOS 3.3

by Mark Harris

hen I purchased my Apple II + a few years ago, my first disk was a model of organization. With only a few programs on the disk, it was easy to find any one of them. Now, with dozens of disks and hundreds of files littered around my basement, I have become a victim of creeping overhead; an ever-increasing fraction of my time is devoted to locating files rather than using them. [Think about me with hundreds of disks-Ed.] I decided that one modest step towards putting things in order would be to alphabetize the catalog on each of my disks.

Of the 35 tracks on a standard DOS 3.3 disk, one (number 17) is set aside for keeping track of usage in the others. Most of the track is taken up by directory entries, each consisting of a file name and type, and a pointer to a track/sector list elsewhere on the disk. While these entries cannot be loaded or stored as a standard DOS file, they can be read and modified in a straightforward manner by the RWTS (Read or Write a Track and Sector) routine described on pages 94-98 of the DOS Manual. I set out to write a program which would read all current directory entries, sort them, and re-write them so that subsequent CATALOGs would list them in alphabetical order.

I first had to decide on what kind of sorting procedure to use, and whether to use BASIC or machine language. I started with the easiest combination to program: a simple bubble sort in BASIC. (For a description of all the sorts mentioned in this article, see [1].] After a few false starts (and destroyed directory tracks), I had the program functioning properly, but it took about two minutes to sort the catalog of a typical disk. I didn't know how the blame should be split between the slow speed of BASIC and my choice of sorting algorithm, so I replaced the bubble sort with the generally-faster Quick sort and tried again. The sorting time was reduced to one minute, but it was clear that BASIC was the primary culprit. I decided to throw in the towel and re-write the program in machine language. I also decided to use an insertion sort, which performs well for a short list (less than 50) that is already partially sorted. I thought this would be appropriate since (1) I anticipated re-sorting my catalogs occasionally as new programs would be added, and (2) a disk cannot catalog more than 105 files, and typically has no more than 30 or 40.

The finished product listed in this article does the sort in under one second. The user is prompted by the program to insert the disk to be alphabetized into the drive (drive 1, slot 6) and to press the RETURN key. Then the program reads the directory entries, sorts them, re-writes them to disk, and calls the CATALOG routine in DOS. From the user's point of view, upon pressing RETURN he sees the alphabetized catalog in about the same length of time required for a standard CATALOG command. It is surprising to find that the disk has been updated in this short interval.

Using the Program.

After you have keyed in and saved the program, a simple "BRUN CAT SORT" will get you under way. The program will ask for the disk to be alphabetized to be inserted into the drive. I strongly suggest trying the program first on disks that you have backed up, just in case you made a mistake in entering the program. Since the program tampers with track 17, which is critical to accessing the other tracks, any scrambling of data could result in the effective loss of all files on the disk. However, you can take some comfort from the fact that even if track 17 is completely clobbered, standard utilities such as "FIND T/S LISTS UTILITY" in [2] can reconstruct the disk.

How the Program Works.

All of the secrets of direct access to directory entries are given in the DOS Manual. The pertinent information is given in the description of the RWTS routine [pp.94-98] and of the diskette directory (pp.129-131). Each file on a disk has a 35 byte entry in the diskette directory on track 17. The first two bytes give the track and sector number of the track/sector list associated with the file, which in turn lists the locations of the actual data sectors. Following the track and sector numbers is a one-byte code for the file type (text, binary, etc.), then 30 bytes for the file name. Finally, the last two bytes give the number of sectors used by the file.

The first byte of the entry actually doubles as a flag. If the associated file has been deleted, an "FF" is entered in this position. If the entry has never been opened, a "00" is used. Since neither value represents a legitimate track number for file storage (track 0 is used for DOS), there is no conflict involved. The idea behind CAT SORT is to keep reading entries into a table in RAM until a "00" is encountered as the first byte. As the entries are read, if the lead byte is not "FF", the RAM address of the entry is put into a separate table. When all entries have been read, the entry table and the address table are duplicated in memory. A sort is done by swapping addresses rather than entries (this greatly speeds up the process) in one of the tables. When this is accomplished, entries in one entry table pointed to by the sorted addresses are transferred to the other entry table in the correct order (at the positions pointed to by the remaining address table). The altered directory is written back to disk, and the CATALOG routine is called to show the fruits of these labors.

The sort used is very straightforward. An insertion sort

uses pretty much the same algorithm that most people would use for a manual sort of a few items. Suppose I want to alphabetize a stack of index cards, each of which has a single name on it. I start by taking the first two cards and swapping them if they are out of order. I take the third card and put it in the correct position in the first two. The fourth card is then inserted into the first three, and so on.

Fast and restless.

The new Delta-15 printer kicks out AnyCalc, easy as 1,2,3!

In a 9 to 5 world full of changing spreadsheet data, you need a business printer that moves fast. A printer that constantly fires out printed information. A printer called Delta-15.

Delta has the ability to print multi-copy spreadsheets at an intense 160 cps. Its throughput never rests. In fact, it never even wavers in speed. That means that Delta constantly fits the most work into every single second.

Delta comes in a 10" or 15½" carriage size. It offers you the flexibility of standard 8K parallel and serial interface. And has the ability to underline, accept macro instruction, and print characters that range from full graphics to everyday printing to scientific notations.

Plus, as always, you get our unique 180 day warranty (90 days on print head).

So for everyone who needs their spreadsheet data "yesterday," this is as close as you can come! The new fast and restless Delta-15 business printer from Star.

THE POWER BEHIND THE PRINTED WORD.

Master Directory For The Apple

By Charles Hill

(Editor's note: This program is much longer than we normally publish. Since we think this is such an outstanding program (similar commercial ventures sell for over \$100), we are publishing it in two pieces. This month contains all the main routines for the menu and reading/writing the library file. Next month we will conclude the program with the print and sort routines.)

t never fails. No matter how hard you try to keep your disk library in some semblance of rational order, it never seems to remain that way for long. Files that you know are on a particular disk have disappeared, and others have mysteriously moved from one disk to another. If this sounds familiar to you, then here is the solution. MASTER DIRECTORY allows you to create one large file directory containing all the CATALOGS of your disks. There is room for 64 disk IDs and 1100 file names. This directory can be sorted and printed in a variety of ways and saved to disk for use later or by other programs.

Operating Instructions

To get started, simply type "BRUN MASTER DIRECTORY". The main menu will then be displayed — six options are available. Press the key corresponding to the number of your choice. If you make a mistake, press return as the next input and you will be returned to the menu.

The first option is to read the in-

Koop all your disk directories on a master life Som and Brin the tile term quick bite ances (or livyour programs)

dividual disk directories. The program can only read DOS 3.3 disks. Pascal and CP/M disks use a different directory format and protected disks can't be read at all. To read the disk, insert it in drive one, enter the disk ID [1 to 8 characters] and press return. When you have CATALOGed all your disks, press return to re-enter the main menu.

The next two options allow the master directory to be saved to or read from the disk. Insert the disk into drive 1 and enter the filename. Any DOS errors that occur will be trapped and the appropriate error message printed.

Option 4 is for sorting the directory. A Shell-Metzner sort is used — it can sort 360 entries on two fields in nine seconds. To select the sort fields, enter the number next to the field name on the sort menu. One to three fields can be entered in any order. The first field entered is the most important descending to the last entered being the least important. The sort returns to the main menu when finished.

Printing the directory is the fifth option. Similar to the sort, up to three fields can be entered for printing in any desired order. To select the field, enter the number of the field from the sort mini-menu. A page eject is issued after each 65 lines. Be sure that top-of-form is set to the top of the page before printing. If this is not done, page breaks will occurr during the middle of

a page. This routine also returns to the main menu.

The last option restores normal DOS and does a BASIC cold-start.

The Program

The program doesn't have a search function because in the time taken to load the directory and find the desired file name will take longer than to look it up in an alphabetized list kept next to your Apple. I keep one of these lists handy at all times. It has proven an invaluable time saver.

The first step is to set MAXFILES equal to 1. Modifications are made to DOS to allow direct access through use of machine language. This technique was described by William Reynolds III in his article Using Text Files From Machine Language in NIBBLE (2:2). Another modification allows the interception of DOS errors after the error message has been printed. The menu box is then set up and protected by lowering the top of the text screen. HIMEM is then lowered by 32 bytes to prevent overwriting DOS. The main loop is entered and a keypress is checked for to choose the correct subroutine. After completion of the main program, DOS is restored to it's original condition and the program iumps to BASIC.

(Continued on next page)

The routine to read the CATALOG first zeroes the disk ID buffer. Each disk ID is stored in this buffer with an index to this name stored with each filename. The reading of individual entries is simple — consecutive directory sectors are read and processed. Each entry is checked to see if it was deleted or the end of the directory. When a good entry is found, the disk index, file type and file name are copied into the name buffer. The buffer pointer is incremented and a memory check is done with appropriate error handling. Then the next entry is read.

The routines to read and save the name file on disk enter the values normally set by BSAVE and BLOAD. Drive 1 is defaulted in the program, however, this may be changed. You may wonder why I use DOS directly rather than printing the commands (preceded by CTRL-D) to execute them. The reason is that DOS stores the letters of a command being printed in the input buffer at \$200. Since this is the buffer where I was reading the filename from while it was being printed, some very strange conflicts occurred. This problem took some time to find, but the new arrangement works perfectly. One item not

mentioned in Reynold's article is that the KEY WORDS FOUND byte at \$AA65 must be set appropriately for some routines to work correctly. The following is a list of these values (Table 1):

그렇다면 생생님이 얼마나 나는 사람들이 되었다. 그 사람들은 사람들이 되는 것이 되었습니다.	77.5

For example, with the BSAVE command, both the Address and Length parameters must be specified, so \$08 + \$01 = \$09. On the other hand, no parameters need be specified with a BLOAD, so the value is \$00.

The Shell-Metzner sort has appeared innumerable times with full ex-

plainations in MICRO and other magazines, so I won't go into any detail here. The only part I will mention is the comparison of Disk IDs. For the file type and name, a direct comparison is made in the entries in the file names buffer. The disk ID is a single number of no alphabetic significance. It must first be converted to an address in the disk ID buffer. The IDs then pointed at are compared and a swap of the entries in the buffer made, if needed. The disk IDs are never reordered, they stay in the buffer in their original entry order and are accessed by pointer only.

There is a ROM multiply routine that I recently discovered that may be of use in your own programming. Put the numbers to be multiplied in \$64,65 and \$AD,AE. After calling \$E2B8, the result returns in the X register (low) and Y register (high).

After getting the numbers corresponding for the fields to be printed, the print routine converts these numbers to a range of 0-2. This value is used to test which field to print. The printer is initialized with a "PR#1". If your printer requires additional initialization, you will have to insert this code into the routine or it may be possible to initialize the printer before running the MASTER DIRECTORY program. The needed titles are printed and the fields are printed centered under the titles. The disk ID and file name are copied directly from the buffer. The file type is printed by borrowing some code from DOS at \$ADDB with some changes so that LISA files are indicated with an "L". When the printing is finished, a "PR#0" disconnects the printer.

Modifications

One useful modification would be to write additional CATALOG read subroutines that could read Pascal, CP/M, Flex or OS9 directories. The code is not that complex so that changing the tracks/sectors and bytes read should be straightforward. If you need more information — the file size, disk volume number, free space remaining or other parameters — it can be read from the disk, stored and printed. Those of you with a 16K (or larger) RAM card can increase the buffer size by expanding into the additional RAM.

You may contact Charles Hill at 226 Park St., Brandon, Manitoba Canada R7A 5M3.

PRO-MODEM 1200

It's about time.

Time for your computer to make the telephone connection — with an intelligent, full 212A 300/1200 baud modem — with a real time clock/calendar — and with the capability to expand into a complete telecommunications system. It's time for PRO-MODEM 1200. Much more than just a phone modem.

When you're on-line, time is money. PRO-MODEM telecommunication systems help you save. By monitoring the duration and cost of your phone calls. And by sending and receiving messages, unattended, at preset times when the rates are lower. . . with or without your computer.

Compare the \$495 PRO-MODEM 1200 with any other modem on the market. For example, you'd have to buy both the Hayes Smartmodem 1200 plus their Chronograph for about \$950 to get a modem with time base.

PRO-MODEM 1200 is easy to use. A convenient "Help" command displays the Menu of operating command choices for quick reference whenever there's a question about what to do next. Extensive internal and remote self-diagnostics assure that the system is operating properly. Some of the other standard features include Auto Answer, Touch Tone and Pulse Dialing, and Programmable Intelligent Dialing.

PRO-MODEM does more. It lets you build a full telecommunications system with features like Auto Dialer, Incoming and Outgoing Message Buffering, Business/Personal Phone Directory, Programmable Operating Instructions, a 12-Character Alpha-Numeric Time and Message Display, and versatile PRO-COM Software. PRO-MODEM commands are Hayes compatible so you can use most existing telecommunications software without modification.

There's much more to the PRO-MODEM story. See your local dealer for complete details. He'll show you how to save time. And money.

APO & FPO: Add 3% (minimum \$5.00) shipping and handling.

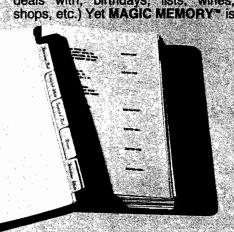

MAGIC MEMORY

Will Remember Everything For You

(If you want it to)

Imagine a system that would record all the wonderous, valuable information you have assimilated onto a single tiny disk. (No more scattered bits of paper, business cards, etc.) Imagine the same system giving you a typed sheet you could put into a notebook or print out for a party and instantly change, or add to, at a moments notice. Imagine cross-referencing to suit both your business needs and personal desires so that all your data was organized into one little black book! On top of all this — imagine having fun putting it together.

MAGIC MEMORY™ is built for the computer rookie. Everyone can relate to MAGIC MEMORY™ because its form is familiar. It looks like an address book but its not. Its more Like the address book, MAGIC MEMORY™ presents an A thru Z index tabulation on the right edge of the video display. The user simply selects a tab and the book is opened to the proper page(s). A second set of tabs are available that can be labeled by the user (i.e.: companies one deals with, birthdays, lists, wines, shops, etc.) Yet MAGIC MEMORY™ is

or any of its special sections.

MAGIC MEMORY'S data presentation screen will instantly adapt to any type of information you may want to store it is only limited to your imagination anyour needs.

MAGIC MEMORY* is designed to operate on an APPLE //e and still remain totally compatible with APPLE | The system will operate in 40 column or 80 columns. You may also use the 70-column display that requires no acciditional hardware.

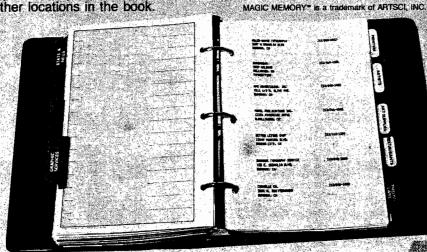

MAGIC MEMORY™ retails for \$99.95 Call 213/985-5763. Use your imagination to outwit your organizational woe

"Imagine" no more. ARTSCI, INC. proudly announces MAGIC MEMORY", the complete advanced database system. MAGIC MEMORY is made to simplify the information storage process.

The typical first-time computer user has no human experience that will help him to relate to a computer's methods of handling information. Therefore, his learning ability is hampered and remains so for many hours of use, UNLESS the computer has been designed to run simply.

much more versatile than the old paper address book. This system can instantly add or delete information, sort alphabetically, and transfer data to other locations in the book.

One of the features in the print section of MAGIC MEMORY* is the ability to print out any or all of the address book,

Disk Dump Program

ere is a program to dump any disk file to screen, printer or whatever. The program asks for what type of disk you have, and then asks for the filename. If you don't know the name, a RETURN will present the possibilities. The dump can either be HEX or straight ASCII. If the file is not straight text, your printer will probably go through a few contortions in the ASCII mode. The program currently has subroutines for DOS and Pascal. I will add subroutines for CP/M, Flex and OS-9 soon.

MICRO

Product Name: Ultra ROM Board/Editor

Equip. req'd: Price:

Apple II \$190.00

Manufacturer:

Hollywood Hardware 6842 Valjean Ave. Van Nuys, CA 91406

Description: A plug-in ROM board with Neil Konzen's GPLE included with 25 ampersand utilities for an on-line editor/utility package. The Global Program Line Editor is a handy set of line editing commands and is available at any time, even with a program already loaded. The utilities include switching in other "&" commands, BLOAD information, control character display, free sectors, line finder, HIMEM and LOMEM settings, graphics screen commands without clearing screen, IF, THEN, ELSE structures, program restore (not new), PRINT USING, memory search, clear end-of-line and -page, help and macro definitions, for single key entry.

Pluses: The program is always waiting to be called. If you forget to load a line editor while working on a program, then you have to save, load the editor and reload the program. With Ultra ROM, a PR#<slot > command will activate the editor, program intact. If you program a lot and haven't used a line editor, get one right away.

Minuses: The "&" additions will only run on a similar system. (A new runtime package is being included for transportability.)

Documentation: A 50-page manual clearly explains how the programs work and how to manage your own vectors.

Skill level required: Some programming experience is necessary for full use.

Reviewer: Phil Daley

Product Name: Robographics CAD-1

Equip. req'd:

Apple II \$1095.00

Manufacturer:

Price:

ROBO Graphics

125 Pheasant Run, Suite 2B

Newton, PA 18940

Description: An extremely sophisticated computer-aided graphics and drafting package for the Apple which has functions, speed and accuracy previously available only on expensive CAD systems. The basic system includes 4 disks, manual, interface module (a copy protection device) and a precision controller much more accurate and versatile than a joystick. It has such features as zoom, pan, angle locks, grid locks, scale drawing, move, find, exchange, line color and type, text entry and more. Pictures

can be stored on a library disk with unique picture labeling and retrieval system. Optional equipment includes dotmatrix printer, plotter, color printer, and digitizer.

Pluses: The system is menu driven and easy to become aquainted with. Scale drawing is accurate and easy to do. Zoom works at many levels of nesting, (greater than 1 part in a billion) giving effectively unlimited screen resolution. Picture complexity is only limited by space on disk. This system has to be seen in operation to appreciate its power: especially its ability to produce highly detailed technical drawings.

Minuses: On complex pictures this system can be slow. Redrawing a picture on screen can take several minutes.

Documentation: An easy to read and well indexed manual answers all questions on operation.

Skill level required: Some drafting experience will help get the full benefit of all the sophisticated features.

Reviewer: Phil Daley

Product Name: Cdex Training for VisiCalc

Equip. req'd:

Apple II +

Price: Manufacturer:

\$49.95 **Cdex Corporation**

5050 El Camino Real, Suite 200

Los Altos, CA 94022

Developer:

Dr. Steven C. Brandt

Description: A real bargain. A program to teach you how to use VisiCalc and to use as reference. 2 disks lead step by step in major concepts and commands of VisiCalc; have review questions, hints, positive reinforcements. 3rd disk is quick reference of commands. Manual supplements material with exercises and reference.

Pluses: Very interactive; easy to use. A professional, topquality package.

Minuses: Disk lessons do not cover all commands, such as window and title commands, but are covered in the reference disk.

Documentation: Well-written, indexed manual contains command reference, examples and exercises.

Skill level required: Anyone interested in learning about VisiCalc. Very little computer experience needed.

Reviewer: Mary Gasiorowski

MICRO

= Apple ====

Reviews (continued)

Product Name: KoalaPad Touch Tablet

Equip. req'd: Apple II Price: \$129.95

Koala Technologies Manufacturer:

253 Martens Ave. Mt. View, CA 94040

Description: A graphics tablet operating from the game controller port with extreme smoothness and precision. The 4 x 4 inch active surface can be activated with finger or stylus. It includes two controller buttons.

Pluses: This product is a great refinement over a joystick. It is much easier and more natural to control than paddles or conventional joysticks. I immediately improved my previous high scores on every game I tried it on. Programming is identical to paddle programming.

Minuses: The KoalaPad Touch Tablet does not have selfcentering such as a joystick has, and removing your finger from the tablet may result in untimely moves during the progress of a game.

Documentation: A very complete, clear and well written booklet is included with the tablet.

Skill level required: No prior skill needed.

Reviewed: Phil Daley

Product Name: Personal Finance Manager

Equip. req'd: Apple II +, or Apple II with Applesoft

Firmware Card or Language System; 48K

RAM; and one disk drive (DOS 3.3).

Price: \$75.00

Manufacturer: Apple Computer Inc.

10260 Badley Drive Cuppertino, CA 95014

Description: A financial program that allows you to budget twenty-four separate accounts which you define. Also available are credit card accounts, and checkbook reconciliation. Defaults make date input and editing a snap. PFM prints out any display you wish and will also move each year's records to another disk for long-term storage.

Pluses: Ample room for the average person, PFM has superb error-handling checks and messages to guide you along. The monthly/yearly updates are helpful and are backed up with a bar graph.

Minuses: You can't track income which would give you a better income vs. expenses picture. Having to continually load modules from disk slows PFM's speed. Not being able to make financial projections will annoy some of you.

Documentation: An attractive and concise booklet is provided with the master disk and backup.

Skill level required: Any person able to turn the computer on and follow directions.

support of disk or tape files

ontional zeroing of user tables

multiple statement support

display of disk or tape file name

Operating Instructions

@ performs calculations
CLEAR zeros aser variable
& enters file mode
Shift CLEAR clears screen
right arrow moves up one line

Using the Internal TIMER

The Color Computer has a special variable TIM which increments once every 1/60 second. You can this timer on a Micro Calc screen to compare the special of BASIC functions. Following is a screen demonstrates this point:

A = 5.3507 T = TIMER $B = A \land 2$ U = TIMER - T U? T = TIMER B = A * A U = TIMER - T

You may be surprised by the results of this compresson between using exponentiation and simple multiplication to square a number. Other comparisons you may wish to try are:

using a number vs. a variable in calculation the SQR() function vs. raising to the .5 power SIN() vs. COS()

MICRO No. 67 - December 1983

VIDEO TERMINAL BOARD **82-018**

This is a complete stand alone Video Terminal board. All that is needed besides this board is a parallel ASCII keyboard, standard NTSC monitor, and a power supply. It displays 80 columns by 25 lines of UPPER and lower case characters. Data is transferred by RS232 at rates of 110 baud to 9600 baud switch selectable. The UART is controlled (parity etc.) by a 5 pos. dip switch.

Complete source listing is included in the documentation. Both the character generator and the CRT program are in 2716 EPROMS to allow easy modification to your needs.

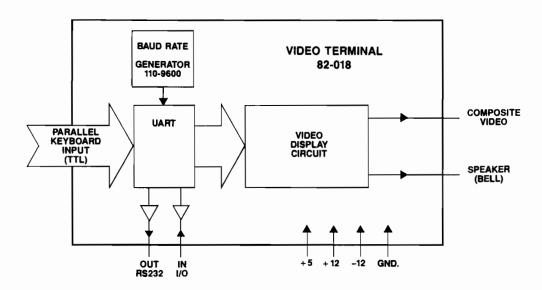

This board uses a 6502 Microprocessor and a 6545-1 CRT controller. The 6502 runs during the horz, and vert. blanking (45% of the time). The serial input port is interrupt driven. A 1500 character silo is used to store data until the 6502 can display it.

Features

- 6502 Microprocessor
- 6545-1 CRT controller
- 2716 EPROM char. gen.
- 2716 EPROM program
- 4K RAM (6116)

- 2K EPROM 2716
- R\$232 I/O for direct connection to computer or modem.
- 80 columns x 25 line display
- Size 6.2" x 7.2"
- Output for speaker (bell)
- Power +5 700Ma.
 - + 12 50Ma.
 - -12 50Ma.

This board is available assembled and tested, or bare board with the two EPROMS and crystal.

Assembled and tested

Bare board with EPROMS and crystal

Both versions come with complete documentation.

#82-018A \$199.95

#82-018B \$ 89.95

MICRO

CoCo Bits

by John Steiner

The Tandon drive is a popular unit, and available from many sources, so we will look at installing these units. The first requirement is a controller board. There are several different brands available, but only two that I know of that are compatible with the Radio Shack format. These are Shack's card and the J&M controller which I have talked about earlier. The Radio Shack card is available as a replacement part, and you can order a replacement case, putting a complete controller together.

The next requirement is a drive cable, which can be ordered from Radio Shack, or you can use any external drive cable for a Model III if you configure your drives (see below). Drive cables are available either in two or four drive versions. The Color Computer drive cables are configured, which means that the cable determines which drive becomes drive zero, and which becomes drive one, etc. Many companies configure the drives, instead. Configuring the cables allows you to swap drives zero and one at any time without internal modification of the units. On the other hand, it is easier to configure the Tandon drive unit, than to configure the cable.

You can buy the configured cable from Radio Shack, or you can order an unconfigured cable from the place you get your Tandon drive units. My recommendation is to order a cable from the drive supplier that has gold plated connectors and configure your drives.

The Tandon TM-100 is a forty track single sided, double density drive. Having forty tracks is of no value to RS-DOS, which writes only to 35 tracks anyway, however if you have FLEX or

another operating system, you may be able to use those tracks by formatting your diskettes for forty track use. In FLEX, the NEWDISK command will allow you to specify number of tracks when it initializes a diskette.

Tandon sells their drives without case and power supply, so be sure to ask about this before you buy a drive unit. A bare drive can be found for around \$200, and a case and power supply will cost about \$50.00. The Dakota Database drive units are housed in a two drive case which cuts down on cost and space. If you are planning on two drives, you might look into that combination.

nis month we will take a look at interfacing the Color Computer to a disk drive. Last month I promised a new phone number for the Dakota Database. It is 701-281-0233, and is available 24 hours a day, except for maintenance. Since mid-July, we have logged over 1000 calls, and have nearly fifty regular users. Most of the users have computers that are not CoCos. Lots of Osbornes and IBM machines check in daily, in addition to Model IIIs and several CoCos. There are even a few data terminals who make a regular appearance.

64K COCO

I have had a chance to check out the new 64K CoCo, and find it to be not much different from the older units. The new keyboard is nice, and is really the same style board with new keycaps. I like both keyboards very well, and prefer the new one, but those who like a longer throw on the keys should look into the Mark Data model, or one of the other professional keyboards.

The formatting problem I was working on last month has been solved. I found my drives to be out of time, just as was suggested to me. My drive zero was way off, and that was probably the majority of my initialization problems with the 1.1 ROM card. The ROM works well with either computer, and my old drives are purring again.

Interfacing a Drive Unit

I promised a look at drive interfacing with the CoCo, so let's take a look at what is required. First of all, any standard Model III drive will work on a CoCo if it or the cable has been configured properly. This opens up a wide market for drive selection, and CoCo users can either shop for price or quality or both. My BBS has two Tandon TM-100 drives which have performed 24 hours daily for over three months with no I/O errors. On top of that, they

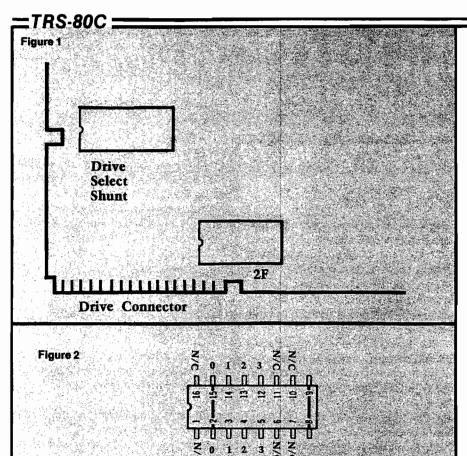

Drive Configuration

Configuring a Tandon drive is easy. The configuration process allows the controller card to distinguish between drive units. On the Tandon, the configuration is done by jumpering a programmable shunt socket. This 16 pin IC socket is located toward the right rear of the circuit board near the drive connector (See figure 1). Some companies provide a DIP shunt which is sitting in the socket, while others leave you to your own devices. If you did not receive a shunt, a common staple will perform the job quite satisfactorily. Figure two is a diagram and pinout of the socket.

Configuration is easy. Make sure to connect pins 9 and 8 together. This is done on all drives. To configure a drive as drive 0, connect pins 2 and 15. Drive 1 requires connections between 3 ant 14. Drive 2 connections are to pins 4 and 13, while drive 3 connections are made to pins 5 and 12. Make sure no other pins are connected, except 9 and 8 and the desired drive number pins. Figure two shows the illustration for a drive 0. Once a drive is configured it can be used as that drive with either a configured or non-configured cable. To use a drive with a configured cable, just connect it as above. Configuration can be changed at any time, should you desire to switch drives.

One last comment, there is a terminator socket (marked 2F) on the circuit board, located near the edge connector. This contains a termination resistor pack. Remove the pack from the socket on drive 0, and any intermediate drives. Leave it in the last drive on the line. I have heard con-

flicting information from different sources about this pack, with some people telling me it can be omitted from all drives. We have left it in our drive 1 without noting any adverse effects. If you have any information about this pack, drop me a line, we will pass it along.

We have installed several Tandon drive systems on both CoCo and J&M cards, and have had no problems If you would like assistance or more information about drives, etc.; give me a call, or drop me a line. I will be glad to help. Send a stamped return envelope for a reply.

Tape Utility

One of the most used utilities in my software collection has been TAPE UTILITY from Spectrum Projects. The program is designed to make it easy to copy files from tape to tape, tape to disk, and vice versa. The programs most useful function is a disk to tape backup. The command BAC is used to transfer all disk files on a given disk to tape. Operation from that point is unattended, and in a little while, all disk files are on tape. There are commands to copy individual files from one media to the other, and a set of directory commands that allow printed and screen directories of both the disk and tape.

There is a tape to disk command that will copy the next tape file to disk, and present you with an option to continue or exit. The command works well, however if you want to dump an entire tape to diskette, you have to be around to prompt the computer to read in the next file. Ken Christiansen of Fargo, ND passed along the following patch that will bypass the prompt and allow the computer to continue to read in tape files. The only disadvantage to this is that when the tape is finished, you have to stop the program with the RESET key.

If you are interested in a patch that will allow the program to work with disk 1.1 ROM, drop me a line with an SASE and cassette. Ken will give you a BASIC program to patch UTIL. Spectrum Projects tells me their latest version now checks for the ROM and will operate properly with either ROM installed. Two things Tape Utility will not do are copy protected programs or copy segmented binary files. It will copy any binary file that was created using CSAVEM.

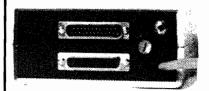

You may contact Mr. Steiner at 508 Fourth Ave. NW, Riverside, ND 58078

P.O. Box 4364 Flint, Michigan 48504 (313) 233-5731 (313) 233-3125

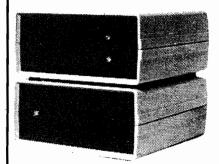

ZANIM SYSTEMS

HOME CONTROL AT YOUR FINGERTIPS

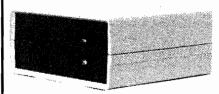

The ZCM-1 is the Master Control module that provides the interface between your computer and our line of Zanim Application Modules. Up to 15 Application Modules can be piggy-backed to the ZCM-1 Master Control module. The ZCM-1 is compatable with any standard RS-232 (serial) interface. A special Master Control module, the ZCM-1V is available for the VIC-20 and Commodore-64 computers.

*The ZCM-1V is available for VIC-20 and C-64 users.

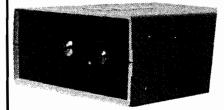

ZAM-1 is the home control interface module that provides a fully versatile computer controlled environment. ZAM-1 can control up to 256 different lamps and appliances in your home or business providing you with an effective and easy to implement energy management and electric control system. No special modifications are necessary to your building as all control signals are sent over your existing wiring. ZAM-1 can be programmed in BASIC or optional home control software is available. ZAM-1 requires one ZCM-1 Master Control module.

*The ZCM-1/ZCM-1V Master Control module is required to use the ZAM-1 Home Control module.

The ZAM-2 allows your computer to continuously monitor up to 15 different doors or windows around your home or business. ZAM-2 is a basic building block in a complete computer controlled home security system. With our ZAM-1 Home Control module, you can have a fully integrated security and environment control system. Upon an intrusion, your computer can take the action most appropriate, whether that is to ring an alarm bell, flash all the lights around your home, or dial the police.

*The ZCM-1/ZCM-1V Master Control module is required to use the ZAM-2 Security module.

The ZAM-3 is a complete telephone answering and dialing system. It is capable of taking the phone off-hook and dialing a number under computer control or of answering the phone when it rings. With the ZAM-1 Home Control module and the ZAM-2 Security module, the ZAM-3 Phone Dialer module can be integrated into a complete home or business security/monitoring system. Applications include security, auto phone dialing, and computer-answering systems.

*Pulse dialing option is available as ZAM-3P.

*The ZCM-1/ZCM-1V Master Control module is required to use the ZAM-3/ZAM-3P Phone Dialer module.

What Make/Model Computer do you own?

IAICRO[™] TRS-80C Reviews

Product Name: C.C. Calc Disk Version

Equip. req'd:

TRS-80 Color Computer 32K

Price:

\$25.00 tape or disk

Manufacturer:

Transformation Technologies

194 Lockwood Lane

Bloomingdale, IL 60108

Description: C.C. Calc is an electronic spreadsheet for the Color Computer. The program provides many of the spreadsheet features found on much more expensive software packages. The spread sheet is 26 x 26, which allows 676 cells. Like most spreadsheets, cells can contain labels, formulas or values. One powerful feature is the ability of a cell to contain both a label and a value. This effectively gives a larger sheet as formulas can be hidden under labels. The smaller size and format allows the personal computer user access to a power spreadsheet.

Pluses: One sheet can be merged with another, allowing the creation of larger effective files. Program documentation includes data file configuration, allowing you to read and write data in your own BASIC programs. Files on the disk version can be loaded with only a single key. The program is very powerful considering its low purchase price.

Minuses: Recalculations are not done automatically, you must recalculate each time data is changed. Because the program is in BASIC, recalculation takes a minimum of eight seconds. Parentheses are not evaluated within formulas, so care must be exercised as to proper formula layout.

Documentation: Seventeen pages of documentation and two sample spreadsheets accompany the software. The documentation is thorough, and allows the creation of usable spreadsheets in a short period of time. Users of Visicalc will find many similar commands and capabilities, only on a smaller scale.

Skill level required: Though I have never used a spreadsheet program before, I was easily tutored, and found operation of the program quite easy to learn and use.

Reviewer: John Steiner

Product Name: Disassembler for 6809 Equip. req'd:

6809 computer w/Flex

Price:

\$75.00

Manufacturer:

Granite Computer Systems

Route 2 Box 445 Hillsboro, NH 03244

Author:

Gilman C. Shattuck

Description: A menu driven 6809 disassembler with user symbol tables. Creates source files compatible with the TSC Editor/Assembler. Output can be to the screen, printer, disk or tape. It has look-up table for Flex and Monitor references, local and global labels and expressions, and equate table for all external references. There is an option for single-step disassembly, data areas are user definable, the program is supplied on 5 or 8 inch disks or tape.

Pluses: The disassembler is menu driven making the use simple and direct. The program is very fast and offers many options for changing data areas, labels, equates, and output. The output listing is the same format as the TSC Assembler and the disk output can be used as input for the assembler. Input is carefully screened to eliminate mistakes.

Minuses: You must have the program loaded before calling the disassembler.

Documentation: The 12 page guide is well written, although a little brief. It describes the menu functions, gives some hints on disassembly and lists some references for more in-depth study.

Skill level required: The documentation assumes familiarity with 6809 machine language programming.

Reviewer: Phil Daley

Product Name: TRS-80 Model 100 portable computer

Equip. req'd: Price:

4 AA batteries (\$3.00) 8K \$799, 24K \$999

Tandy Corporation Manufacturer:

Fort Worth, TX

Description: Gets my vote for product of the year! A truly useful portable computer. Includes all needed software and hardware interfaces for effective use alone or with other computers. 90 day limited warranty. Highly recommended.

Pluses: CMOS 80C85 processor and memory allows up to 20 hours of operation at 2.4MH without a cord. Large 8 line by 40 column LCD display is easily usable indoors and out. Includes full-size full-stroke keyboard, able to generate all ASCII codes, character and high-resolution graphics, and emulate a numeric keypad. Alpha lock, function keys, and cursor controls also supported. Interfaces include a 300 cursor controls also supported. Interfaces include a 300 baud modem (direct connect cable \$20, acoustic coupler planned), RS232 and Centronics parallel ports (cable \$15), and a 1500 baud cassette interface (cable \$6], as well as sockets for added RAM, ROM and an expansion bus.

Software is fully integrated, menu-driven and supported by function keys, providing ease-of-use comparable to Apple's "LISA" at 1/10th the price. The built-in word processor is simple but elegant, with all needed features. The smart terminal is entirely adequate for even serious use, as is the highly-extended Microsoft BASIC. A primitive address list and notebook are also included.

Minuses: Cursor controls are not supported from BASIC, and line-feeds after carriage returns are not selectable. The quick reference manual and the LCD display could use protective covers, and a built-in microcassette recorder and TV output would be welcome.

Documentation: Comes with a tiny quick reference manual and large spiral-bound user guide with index. Includes enough information in the first few pages to use all programs effectively, and covers all details of use later in a format that is ideal for reference. Does not attempt to teach BASIC to beginners.

Skill level required: My 7 year old used it easily the first day. What more can I say?

Reviewer: Jim Strasma

Product Name: 64K Disk Utility Package Equip. req'd: TRS-80 Color Computer Disk

system 64K

Price: \$21.95 + \$3.00 shipping

Manufacturer: Spectrum Projects

93-15 86th Drive Woodhaven, NY 11421

Description: The 64K disk utility package is a collection of three useful programs for the 64K Color Computer. Now that Tandy is producing a 64K compatible computer, and many users are upgrading their machines to support 64K. commercial software is starting to use the capacity. The program includes 40K, ROMCRACK, and a print spooler. 40K is a program that moves BASIC from ROM to RAM, and relocates it so that your BASIC programs have access to larger data areas. ROMCRACK will transfer ROMpacks to disks, and the software spooler will allow you to run and use BASIC while the printer is getting spooled output from a buffer in upper memory.

Pluses: 40K provides extra data storage area for large string arrays, etc. The print spooler will allow you to continue programming or working with your computer while printing from a large buffer in the upper RAM. ROMCRACK will transfer most ROMpacks to disk with very little hassle.

Minuses: 40K has a limiting factor in program size, and the extra memory must be used as variable and string space, or the program could crash. The print spooler works

(516) 744-6462 9AM-5PM Weekdays well with three reservations, it must be available by the time you read this. It slows the computer down, programs run slightly slower. Lastly, the program data being spooled must use BASIC's character output routine (not usually a problem). ROMCRACK won't handle some ROM packs that test to see if the program is residing in RAM before executing. Some packs fit this category.

Documentation: A single sheet of information instructs thoroughly in the operation of the three utilities.

Skill level required: These utilities are for the average BASIC programmer, no great skills are required of the user.

Product Name: Disk COLORCOM/E Smart Terminal

Software

Equip. req'd: TRS-80/TDP 100 Color

Computer/MODEM

Price:

\$49.95 + \$2.00 shipping

Manufacturer: Eigen Systems

P.O. Box 10234 Austin, TX 78766

Description: The Disk COLORCOM/E Smart Terminal program is a sophisticated terminal program that supports up/down loading, disk files, and a full complement of RS-232 functions and features.

Pluses: The program is easy to use, and very sophisticated. It is menu driven, and the user can set up just about every possible printer/modem computer parameter desired. All 127 ASCII codes may be sent from the keyboard. The receiver buffer can be opened for saving of data, and closed as desired if you decide to eliminate excess information from your disk. The software handles graphics characters easily, and does an impressive job on Spectrum Projects BBS graphics displays. Initialization files can be saved and loaded for maximum convenience.

Minuses: The software comes on a copy protected diskette, so you must load and run the program from it, transferring to a file disk when loading is complete.

Documentation: A 23-page manual is included that steps the user through the program with ease. Some functions needed further explanation for me, for example, "capture characters".

Skill level required: The program is easy to learn, and beginners can use it with little trouble, ignoring its advanced features. As the user becomes more expert, the extra capability can be put to use.

I/O EXPANSION BOARD

For microcomputers that use 6522 VIAs for I/O and do For microcomputers that use bozz vivus in VO and on not provide full address decoding on board. This board has physical space for four additional 6522 VIAs, and provides additional decoding for a total of 16 devices. Two versions of this board are available. The VOX.122 mounts above, and directly plugs into, an on-board 622 socket, and relocates the original VIA to the expansion board. Where there are space limitations, the I/OX-222 uses a dip header and an 8" cable for remote installation.

32K CMOS STATIC RAM BOARD

Models MB-132/32K, \$299 /16K \$241,/8K \$197

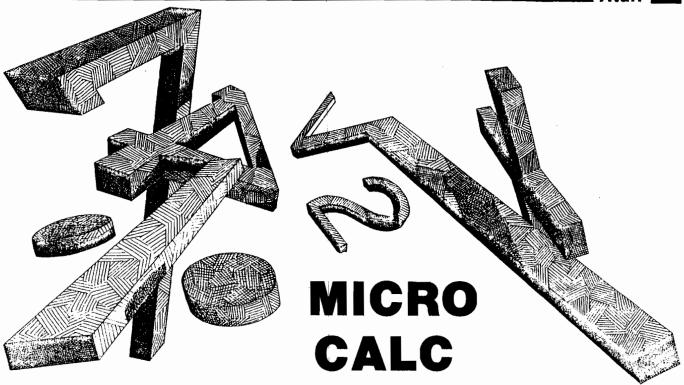

Features:

- 200ns Low Power CMOS, STATIC RAM
- Extends your expansion connector

\$250

- Plug compatible with 2716 EPROMS
- First 8K are jumper selectable · Entire board may be bank-switched

All boards feature G-10 glass/epoxy, solder mask, and gold plated connectors. All boards carry a full 1-year limited werranty. When ordering specify SYM or AIM version; add S & H in U.S. and Canada \$2.50, overseas \$4.00 (US). Calif. residents add sales tax

Comments on Atari listings

Starting this month, our Atari listings are being output on the EPSON FX-80 printer. This printer allows redefining some or all of the Epson ROM character set. After much testing, we arrived at a compromise set of characters. Since many of the reversed characters would be difficult to read at the size of these listings, we thought that it would be clearer for the reader typing these programs into his computer to underline the reversed characters. The Atari programs that follow utilize this new style of listing. If anyone has any comments, pro or con, drop us a line with your viewpoint.

Features:

- ∠24 working lines
- ∠24 corresponding comment fields
- support of disk or tape files
- multiple statement support
- → BASIC screen editing features

Operating Instructions

ESC START performs calculations ESC OPTION enters file mode ESC SELECT enters comment field Shift CLEAR clears screen

A Brick Wall Demonstration

et ready to hit the bouncing ball with your bumper and knock out a few bricks. The farther away the brick is, the more points you will get for knocking it out. If you are dexterous enough to knock out the entire wall of bricks, don't get over confident, the game will continue with an even harder screen of bricks.

Breakup is a simple graphics display game that presents the principles of animation with player/missile graphics to move characters on the screen and test for collisions. It includes a ''ball'' that moves around the screen, rebounds from struck objects, and knocks out bricks in the walls of bricks. It also includes a player-controlled ''bumper'' to keep the ball from going out-of-bounds and being lost, a defined playing field with three walls from which to bounce the ball, and some eight rows of blocks, the amount of points received for hitting them dependent upon their color and distance from your bumper.

The game keeps score by color; 5 points for the green at the bottom, fifteen for the blue above it, and twenty for the yellow-orange blocks just above that. When you clear the entire screen, you are awarded an extra ball, the paddle shortens by one dot and moves closer to the blocks. This continues, screen after screen, until the bumper is as small and as close to the bricks as it can be. In addition, the points received for hitting the blocks are all increased by 3 points. That is, when you are playing the second screen, the green blocks at the bottom of the screen are eight points. If you manage to get to even the next screen, they will be worth eleven, and so on. Unlike the size of the bumper, the values for the bricks have no limit, and may increase in value for as long as you can play the game.

Operating Instructions

- Key in 'BREAKUP' from the listing and save it on your tape or disk, and then RUN it.
- 2. First you are asked whether you will play from paddles or the keyboard. Choose the corresponding letter P, or K.
- The program will display the playing field, the brick walls, and your bumper. When you are ready to start play, press the button on the paddle, or the START key on the system console.
- 4. If you have chosen the keyboard use the cursor left arrow and cursor right arrow keys to move the bumper left and right. Holding the shift key at the same time increases the speed of the bumper.
- If, for some reason, you halt program execution with the Break key, you must hit the SYSTEM/RESET key before re-RUNing. This will be further explained later.

The Program

The ball starts from a random position at the bottom of the screen and travels upwards, hitting a brick. This causes the brick to disappear, adds the appropriate amount of points to your score, and rebounds the ball towards the bottom. Here is the challenge: You must hit the ball back with your bumper to keep the ball from traveling out-of-bounds and off the screen, thereby losing the ball. If you are successful, the ball will simply hit another brick and bounce back. If you miss the ball, a buzzer will sound and the program halts until you hit the paddle or the START

button. You are allowed six balls total, plus an extra one for every screen you clear. Also, the angle and relative speed of the ball increase the closer you hit the ball to the ends of the bumper. Hitting the ball near the center of the bumper helps to restore the ball to a less radical angle.

Breakup's Animation: The Idea of Player-Missile Graphics

The animation in Breakup was done with the Atari's Player-Missle (PM) graphics capabilities. I used PM graphics because the speed of moving figures (players) around on the screen, such as the ball and paddle, is very fast. Also, PM graphics makes it very easy to test for collisions. This makes for a faster and more challenging game. In fact, even machine language versions of this game, which generally don't have to worry about speed due to the speed inherent in machine language programs, use PM graphics because of its ease of use.

A player is a zone on the screen that is eight pixels wide and extends vertically off both the top and bottom of the screen. A missile is generally a very thin player; it is only two pixels wide and likewise, extends past the top and bottom of the screen. There are several locations (registers) that correspond to the characteristics of each of the players and missiles, such as color, pixel width, priority, collision detection, and horizontal position of each. The reason the players and missiles are so relatively thin when compared to their height, stems from the fact that there is no vertical position register for them, only a horizontal position register. This means that in order to move a player vertically (as needed by the ball, for example), we have to physically redraw the player either higher or lower in memory. But before we deal any further with the describing locations of PM graphics, lets first uncover how the Atari handles PM graphics in the first place.

The Atari allows for four separate players on the screen and four missiles, or five players if you combine all four missiles and treat it like a player. There are in general, two types of players, those drawn in one line and those drawn in two line resolution. One line resolution is just that; the players are drawn out one scan line at a time. Two line resolution is simply drawing the players out two scan lines at a time. One line resolution, while it allows for better looking pictures, takes 2K of memory to store, while two line resolution takes 1K of memory to store. Each player in one line resolution takes 256 bytes to describe (one for each scan line from the very top of the screen to the bottom), and each player in two line resolution only takes up 128 bytes as each byte corresponds to two scan lines instead of simply one. Note that not only does the better resolution take up more room, but the memory used for it must start on a 2k boundary (the starting location must be divisible by 2048) while the two line resolution memory only has to start on a 1K boundary (starting location is divisible by 1024]. Thus we have to be somewhat careful in our placement of the player-missile memory.

The Atari finds this memory through its base address register, which is location 54279. That is, location 54279 tells the Atari where to go to find out what the Players look like. But since the location is only one byte in size (it is only one location) it has to hold the page number of the

PM memory. A single byte, which can hold any number from 0 to 255, will be able to address any one of the 256 pages in the Atari. The paging method is simply a way for the Atari to find its way around with only one byte telling it where to go.

That's the Way the Ball Bounces.

Another time saving feature of PM graphics is its collision detection capability. A collision occurs when any player or missile touches something other than the background. This capability allows the program to, with a single PEEK statement, find out if anything is hitting any one of the players or missiles, or if they are touching anything. This makes the whole checking routine for the ball and paddle collisions very fast.

The way this collision detection works is simple. There is a register for every possible PM collision. The Player to Playfield collisions register is the location that is read constantly to see if the ball (player 0) has hit something, so that the appropriate ball movement routine can be activated. Similarly, the player to player collision register is read to see if the paddle has hit the ball.

Combining a few things...

To make the colored bricks, we used redefined characters in graphics mode 2. We used characters simply because of the color capability, and ease of drawing and erasing. Characters in graphics mode 2 can be displayed as four different colors. So, we re-defined the character "\$" to a 7 dot \times 5 dot brick.

The first 384 bytes of memory (in double line mode) are always unused. And the first 512 bytes remains unused because this program did not enable the missiles (everything is done with the players.) This means that we have 512 bytes sitting there on a 1K boundary, doing nothing. This is perfect for a graphics 2 character set. By using this space for the somewhat altered character set, we can store something that would normally require $1\frac{1}{2}K$ (1K for the PM storage, and $\frac{1}{2}K$ for the character set) in only 1K.

The actual movement of the ball was calculated out in BASIC and executed in machine language. This is because, as mentioned earlier, PM graphics is great and quick for moving figures horizontally, but vertical movement must be done manually. BASIC proved to be much too slow for this. There are other ways around it, but having a machine language routine was the easiest.

Program Description

The routine to move the ball and the paddle, test for collisions, and do anything else involving animation is entirely contained in the lines 100 to 190. Note that this routine is almost at the very top of the program; all initialization and other routines are done below it. This is a programming trick to speed up the game, because the more lines that exist above a routine, the slower that routine will be. This has to do with the fact that when a GOTO is encountered, BASIC starts looking for the destination line number from the top and checks them all one by one until it finds where it has to go. This takes

Best Sellers From time, and if you have a lot of lines above the routine, this will take a lot of time. Therefore all routines that are not time dependent, such as the initialization and score keeping routines, appear below the movement routine. In this way, no time is wasted during the movements.

Line 10 dimensions all the strings and arrays used by the program: M\$ holds block move routine discussed in previous chapters, M2\$ holds the ball movement routine, BALL\$ holds the Player-Missile description for the ball (only twenty bytes worth), A holds the possible angles resulting from a collision with the bumper, P holds the points for each line of bricks on the screen, and PAD holds the descriptive byte that describes how the paddle looks from screen to screen. All of these will be covered a little better in a minute.

Line 20 calls the initialization routine at line 30000.

Line 30010 lowers the top of memory pointer by 1K (four pages) to make room for the player-missiles and new character set. Fortunately, location 106 points to a 4K boundary, so subtracting 1K from this location insures that the location will be on a 1K boundary (it will be divisible by 1024). The graphics 1 screen is initialized right after the pointer is moved, so that the computer can re-adjust the appropriate pointers to the new loss of 1K memory.

In line 30012, START is assigned the address of the new memory area, and the two machine language routines are loaded in.

Line 30014 pokes the starting location with a zero and propogates it through the entire 1K by moving 1023 bytes from the starting location to just the following location.

Line 30020 uses the Block Move routine to move the standard character set from ROM to the new memory allocated just before the PM memory area. This allows us to redefine the few characters we have to and keep the rest of them as they are.

Line 30030 and 30040 make players 2 and 3 into the left and right walls of the game. These walls could have been merely character, as is the top wall above the bricks, but they were made as players so that a single check could be made to determine if the ball should bounce horizontally or not.

Line 30044 puts the description of a 7 dot wide paddle into the player 1 area.

Lines 30050 to 30054 redefine the two characters whose internal value is 4 and 5 ["\$", and "%" respectively], to the brick and solid block. The latter is used in the drawing of the wall on the top of the screen.

Lines 30060 to 30066 define the values of all the constants in the program. The majority of these are the locations for characteristic changes in the player missiles.

Line 30070 opens the keyboard for later input. It will remain open during the entire execution of the program.

Line 30080 sets up all the game values. (See the variable tables for details).

Lines 30082 to 30090 load in the values for the A, P and PAD arrays.

Lines 30100 to 30120 asks the user if he wants to play via paddles or the keyboard. CTRL holds the line number of the appropriate bumper routine.

The routine found at lines 30200 to 30260 initialize the screen. The PM graphics are enabled, the character set is

Line 50 pauses the game until either the paddle or START button is pressed. This gives the user time before the ball is released.

The entire game is controlled through lines 100 to 190. In line 100, the horizontal and vertical displacements are added the the X and Y coordinates of the ball. Then the paddle is moved [CTRL is the line number of the appropriate routine]. A machine language routine that moves the ball within the player is then called. This is what happens in the routine:

The routine is passed the following values:

x coordinate,

y coordinate,

the starting location of the ball description, the start of Player 0 (where to put the ball), and, how many bytes of the ball description to move

Player 0 is moved horizontally (only one location to change)

Player 0 is moved vertically

The collision registers are cleared

The routine then waits for 1/60th of a second,

and then returns to BASIC

Clearing the collision registers is performed by the internal workings of the Atari whenever location 53278 is POKEd with any number. 1/60th of a second is waited out to allow the collisions to register.

Line 110 assigns the needed collision registers to the following variables: BPF (for the ball to character collisions), BPL (Ball to wall collisions), and PB (Paddle to ball collisions). Y is then checked to see if the ball has been missed.

Line 150 turns off any sound that may have turned on by some previous collision. BPF is then checked to see if it has hit playfield 0, 1 or 2 (one of the hittable bricks. If a collision has occurred, then control is passed to the brick routine at line 200.

Line 160: If the ball has hit playfield 3, then reflect [negate] the vertical displacement and make a sound.

Line 170: If the ball has hit either wall, then horizontally reflect it and make a sound.

Line 180: If the paddle has hit the ball then vertically reflect it. H is then assigned the appropriate angle of horizontal reflection. A sound is made.

Line 190 returns control back to line 100 in the event that none of the above has occurred.

Lines 200 to 210 handle the brick colliding routine:

Line 200 prints a space over the brick, effectively erasing it, adds the appropriate amount of points to the score, vertically reflects the ball, makes a sound, and subtracts one from the number of bricks variables (NB).

Line 202 prints the score. If NB is zero, then control is passed to the new screen routine.

Line 210 passes control back to the main loop.

The value of CTRL is set in the routine at 30100, and is either a 300 or a 400. CTRL is the line number of the appropriate bumper routine. If the game is controlled by the paddles then CTRL is 300, and if it is controlled by the keyboard, then CTRL is 400. Line 300 assigns the variable PP with the paddle position negated and moved to the right a little. The Paddle value was negated so that paddle movement would correspond to the bumper movement on

the screen. Lines 400 to 420 move the paddle left or right one pixel depending upon whether the left or right arrow key was held down. If the shift key was held down then the paddle is moved in the direction specified by five pixels instead. This allows the paddle to speed up if it has too.

Lines 500 to 550 contain the missed ball routine. If the number of balls left is greater than zero then, the game values are re-initialized, the number of balls left is decremented by one, and the game resumes at line 50. If the number of balls is zero, then the game is over, and you are asked if you wish to try again. If you specify "N", then the top of memory pointer is reset to its original spot, and the program halts. If "Y" was specified, the top of memory pointer is reset, and the program is re-RUN. Note that if the program is stopped via the Break key, and rerun, the top of memory will be even lower than it was before. If this is continued, the computer will eventually run out of room and unrecoverably crash. It is for this reason, that whenever the program stops via the Break key, the user should hit SYSTEM/RESET.

Lines 600 to 690 handle the screen clear routine. If it can be done, the paddle is shorted by one pixel and moved up three lines. This is done at line 610 by block moving the description bytes for the paddle up one byte three times. Between each move upward, a sound is briefly made and a delay occurs, so that the changing of the paddle is more obvious. SZ is a flag telling the program that there is still room to move the paddle upward three lines and that the paddle can still be shortened. It is incremented every time the paddle is raised. If SZ ever reaches 7, then the paddle is no longer raised or shortened every time the screen is cleared. The points received for each brick struck is also increased by 3 for each consecutive screen. When this routine is done, the game values are re-initialized and the game resumes at line 50.

The DATA statements on lines 32010 and 32110 hold the two machine language routines in string form. These are read in to the appropriate strings during the initialization routine.

The rest of the DATA statements on lines 32210 and 32220, 32310, 32410, and 32510 hold the values for the new characters in the character set, the paddle angles, the points received for the blocks per line, and the paddle sizes per new screen, respectively. They are likewise read into their appropriate variables during the initialization routine.

In a few millionths of a second, common electrical surges and spikes can enter your data processing equipment and cause memory loss, false logic and misregistration. Surges very often do permanent damage to microcircuitry.

FLEXIDUCT Surge Suppressors catch surges and spikes before they have a chance to enter your equipment. In billionths of a second (Nanoseconds), **FLEXIDUCT** Surge Suppressors dissipate surges and spikes from any side of the line (most protect only one side).

The multi-outlet unit is ideally suited to the computerized workstation. It gives you the advantage of circuit breaker protection with plenty of outlets for data processor and peripheral equipment.

No computer should be without the protection of a **FLEXIDUCT** Surge Suppressor...**especially yours!** Write or call for further information. Available from office products retailers.

Surge Suppressors

a product of Winders & Geist, Inc. P.O. Box 83088 Lincoln, NE 68501 402/474-3400

MICRO™ 人

From Here To Atari

by Paul S. Swanson

he listings accompanying this column provide my Christmas greetings to you. The assembly code is for reference. The BASIC program contains the resulting machine language in the data statements. It is an example of using display list interrupts. Enter the BASIC listing to see a color display.

Several display list interrupts control the changing colors in the triangular "tree" in the display and two more are used to color the trunk and to change the text window background to black. Every line of the mode 5 triangle has an interrupt on it. The colors are rotated under the control of the BASIC program.

The BASIC program begins by drawing the tree using dots of random colors. The background color is the only one not used in that section. Later, the display list interrupt will constantly alter the contents of the referenced color registers. The trunk is drawn with the color from register 2, which is declared in BASIC with COLOR 3. This is the same color register used for the text background.

Establishing the points for the interrupts is done in lines 120 through 160. First, DL is set equal to the location of the display list. Next, all of the bytes controlling lines 1 through 31 are altered. The 138 used is the code for GRAPHICS 5, which is 10, plus 128, which sets the display list interrupt enable bit. The tree occupies screen lines 1 through 30 and screen line 31 is the first line on the trunk. The line before the text window gets the last interrupt, which will be used to set the text background to black.

The display list interrupt is read into page six in lines 170 through 190. The vector is set up to point to the routine in line 200 and the first statement in line 210 enables the interrupt. Q is used to control the color base for the interrupt routine and A controls whether the message is "MERRY CHRISTMAS" or "HAPPY NEW YEAR."

The BASIC loop that occupies lines 220 through 280 alters the color base and prints the messages. The interrupt is going constantly, so the BASIC program does not need to call anything. All that it changes is the contents of location 1664, which is used by the interrupt as the color base. The two phrases, controlled by A, are printed using the loop at lines 230 through 260. The FOR/NEXT loop within that loop controls the timing for printing the individual letters. Lines 270 and 280 dorm a delay at the end of each phrase, then set up A to point to the other phrase.

The assembler routine starts by saving the three registers on the stack. Since it is interrupting the program and it will use these three registers, they must be saved. Otherwise, the program that is interrupted will have the wrong values in the registers when the interrupt returns.

VCOUNT contains the number of the current screen scan line divided by two. This will serve to divide the in-

terrupt into three parts. The triangle shape requires a color rotation, the trunk requires that register 2 be set to brown and the text window requires that register 2 be set to black. VCOUNT is 79 at the interrupt where the trunk color is to be selected, so it is compared to 79. If it is found to be 79, a branch is made to STUMP, where brown is stored in register 2. If it is found to be greater than 79, a branch is made to WINDOW, where register 2 is set to black.

If it is neither equal to nor greater than 79, the color rotation is performed. Since the interrupt happens during the last scan line of the previous mode line, a STA WSYNC, which stops the processor until the end of the current scan line, must be performed before the registers are changed. Preparation for this involves placing the proper colors into the 6502 registers.

The colors are based on whatever is in location 1664, which is controlled by the BASIC program. This is added to VCOUNT and placed in register Y. For register X, \$15 is added to the color and \$2A is added for register A.

The STA WSYNC is performed next, immediately followed by the three statements that place the colors in the registers. Although the timing is not critical in this program, because the colors affected are not near the left edge of the screen, the placing of the colors takes place totally within the horizontal blank period. The three store commands require 12 machine cycles and there are 26 in the horizontal blank period, although a few of these are stolen by DMA.

Since the color changes are not critical for the trunk and the text window, WSYNC is ignored and the colors are stored directly into the color registers. The \$26 is equivalent to SETCOLOR 2,2,6, which is the brown used for the tree trunk. In WINDOW, the background is set to black and the text (register one) is set to a medium white.

The EXIT routine must restore the three registers in the reverse of the order in which they were stored on the stack. After restoring the three registers, the interrupt mask (processor I bit) is cleared and the return from the interrupt is performed. The processor I bit is set when the interrupt is called and leaving it set prevents other interrupts from altering the timing in this interrupt.

POKEY Timers

Another interesting set of interrupts are controlled by POKEY, which is the device responsible for the sounds and operation of the serial I/O bus. There are three POKEY timer interrupts available for general program use, referred to as POKEY timers 1, 2 and 4. These use the values in the AUDF registers, which are the same ones used for generation of sounds.

The advantage to the POKEY timers over the display list or vertical blank interrupts is that they are controlled through independent counters. Display list and vertical blank interrupts depend on the 60 Hz television frame rate and cycle at that frequency. The POKEY interrupts are completely controlled by frequencies which can be set by software.

To get an exact frequency with a POKEY timer is not that easy unless the frequency you want is an even multiple of the clock rates. There are three clock rates available, just as there are for the sound channels. In fact, they are the same sources. The "normal" frequency, which is the one selected when the system is booted, is 63.9210 KHz. This may be changed to count at 1.78979 MHz or 15.6999 KHz. When the interrupt routine is enabled properly, an interrupt happens each time the counter reaches zero. The frequency set for the clock rate can be used to calculate the frequency of the interrupt. The interrupt frequency is equal to:

the clock frequency /{2 * |1 + number in the AUDF register|}

POKE the value N into the register and the frequency of the interrupt is the frequency set [the 64 KHz or 15.7 KHz]/[2*[N1]]. For 1.79 MHz, there is a slight modification of the formula. Divide the 1.79 MHz by two times the sum of N plus 4. If you are clocking two channels together, use 7 instead of the four. If you don't know what that means, use 4.

When you use the timer interrupts, pay close attention to what is on the system stack. Before jumping through the timer interrupt vector, the operating system pushes the A register onto the stack. Before your routine starts, you should push the X and/or Y registers onto the stack if you intend to use them. Before you return from the interrupt, pull X and/or Y registers off the stack, then PLA and clear the interrupt with CLI. If all that was pushed onto the stack is not pulled off, or if more is pulled off than was put on, the system will crash or at least lock up as soon as you enable the interrupt.

The method for implementing the POKEY timers is stated inaccurately in the manuals. If you set it up the way the manual states, your system will lock up and you will have to press SYSTEM RESET to continue. Instead, first set up AUDCTL (\$D208, or 53768) with zero for 64 KHz, one for 15 KHz or 96 for 1.79 MHz. Next, set the volume [AUDC1, 2 or 4 at \$D201, \$D202 or \$D204 53761, 53762 or 53764). Now you can set up your software interrupt routine and change the interrupt vector to point to it. The three vectors are at \$0210, \$0212 and \$0214 (528, 530 and 532). The above steps can be in any order. After all of them are completed, start the timer by POKE 53769,0 (actually, any number from 0 to 255 can be POKEd here and you will get the same effect). After all that is done (not before the POKE 53769, which is what the manual states, enable the timer interrupt.

Enabling the interrupt involves PEEK[16]. Add 1, 2 or 4 to that value, which corresponds to the interrupt you are using, and POKE the number back into location 16 and also into location 53774. Once you do that, your interrupt will begin and an interrupt will be generated when the timer you set counts down to zero. As soon as the interrupt happens, the timer is automatically loaded with the value you origionally POKEd there, so the process repeats until you disable it.

Problems to Watch For

Problems associated with POKEY timer interrupts involve timing and other interrupts. DMA can alter, unpredictably, the amount of time between the interrupt and the first action taken by your interrupt routine, making the timing a little less precice. The average over several interrupts will be at your selected frequency, but the timing

between two consecutive actions may be off by a few clock cycles if DMA is not disabled.

Other interrupts can also introduce problems. The major problem is the vertical blank interrupt. The only solution to this is to turn off the interrupt, and the display list interrupts if any are enabled, by POKEing a zero to location 559. Make sure you do all your SETCOLOR, GRAPHICS and other statements that depend on shadowing first or resort to using the hardware registers. That POKE also turns off the real time clock and keyboard auto-repeat.

Another interrupt source is the IRQ interrupts. These can be masked out by setting the corresponding bits in locations 16 and 53774 to zero, storing only the 1, 2 or 4 for the POKEY interrupt in those locations. Another possibility is to SEI at the beginning of the interrupt (don't forget CLI at the end).

If you do not disable the keyboard, you may get some additional delays on some of the interrupts. The keyboard click uses the STA WSYNC command, which stops all processing, including interrupt servicing, until the end of the current television scan line is complete. Also, any other interrupt that leaves the processor "I" bit set will cause the processor to ignore the interrupt. Peripheral access may do this.

If you set up the POKEY timers to do something for you, you may have few, if any, problems with them. The problems mentioned above can be used as places to check if the timing is found to be innaccurate. If you set everything up the way I have described and the system locks up when you enable the interrupt, your machine language may have a fatal error. If you find no error, turn the computer off then on to reboot and try it again.

One undocumented note on the POKEY timers is that you can change the frequency between interrupts. If the calculations for the desired frequency are not exactly what you want, maintain a counter somewhere in memory. At the beginning of the routine, use STA to put the value into AUDF that BASIC placed there. Increment the counter and test it to see if it counted to where you want to make an adjustment. If it is there, store the adjustment frequency into AUDF and reset the counter to zero. The next interrupt will obey the new frequency, then put the old frequency back into AUDF. Remember that this is not documented, so it may not work on all Atari computers. Test it out before you depend on it.

Enabling the POKEY timer interrupts involves a lot of calculation. However, if they are properly enabled, very precise timing can be done with them. I am preparing a project using those timers and I will be writing an article describing it completely.

Next Month

I recently acquired an ATR8000, which is a device containing a Z80 processor, memory, a printer port, an RS-232-C port and disk controller logic so that you can hook up "bare" disk drives to your Atari. The ATR8000 offers CP/M compatibility and, when the CP/M option is not in use, the ATR8000 will act as a printer buffer. A functional description of the ATR 8000, along with pricing, will be featured in next month's From Here to Atari.

You may contact Paul at 97 Jackson St., Cambridge MA 02140

Computer Software Associates, an established software house, supplies software for COMMODORE, APPLE, and IBM home computers. CSA is currently looking to expand its product base of serious programs in the areas of home, education, and office.

Computer Software Associates offers over 30 years of market experience, worldwide distribution, innovative packaging, generous royalties, and programmer support.

Interested programmers should contact Mike Mahan, Product Development Department, Computer Software Associates, 50 Teed Drive, Randolph, Massachusetts 02368. Tel. (617) 961-5700.

MICRO[™] Atari Reviews

Product Name:

Square Pairs

Equip. req'd:

Atari Computer, BASIC, Cassette Player

Price:

Manufacturer:

Scholastic Inc. 906 Sylvan Ave. P.O. Box 2010

Englewood, NJ 07632

Description: A game of matching. Square Pairs allows up to four players to take turns uncovering two boxes at a time and finding two that match.

Pluses: Even though there are three games included, the most interesting part of the program is the ability to make up your own games. After making up a game it can be saved on tape. This allows for more game variety.

Minuses: The program is only available on tape and will only interact with a Atari cassette recorder.

Documentation: The sixteen page manual is clearly written. Most of it is applied towards making up and saving games.

Skill level required: Designed for seven through twelve years of age. May not have much attraction to those over ten.

Reviewer: Richard E. DeVore

Product Name: Turtle Tracks

Equip. req'd:

Atari Computer w/32K, BASIC, Disk

Drive, Atari Printer optional

Price:

Manufacturer:

Scholastic Inc.

906 Sylvan Ave. P.O. Box 2010

Englewood Cliffs, NJ 07632

Description: Turtle Tracks is an interesting method for children to learn the fundamentals of programming. By typing in simple programs, they are shown, by a "turtle" drawing on the screen, exactly what their program does.

Pluses: The self-booting program is well error-trapped, allowing mistakes to be made without crashing. It allows loops and variables, demonstrating on the screen what they do. There is also a small segment on sound with enough information to let you compose simple music. If there is an Atari printer connected to the system, a print out of the screen may be made by just pressing the OP-TION key.

Minuses: The program is slow in accepting keyboard input. The longer a program gets, the slower the cursor responds. Program execution is also slow.

Documentation: The eighty page manual is quite well done. It carries you from loading the program through saving and reloading your work. One of the clearest for children I have seen.

Skill level required: Beginner, recommended minimum starting age is nine years old.

Reviewer: Richard E. Devore

Product Name: MMG Data Manager

Equip. req'd: Atari Computer w/48K, BASIC, Disk

Drive: printer optional

Price: \$49.95

Manufacturer: MMG MICRO SOFTWARE

Manalapan 1000 Office Building

1000 Route 9

Englishtown, NJ 07726

Description: MMG Data Manager is a file management program for any Atari computer with sufficient memory and a disk drive. You may set up your records and fields to suit your particular needs. Although a BASIC program, it has machine language routines and is quite fast in use.

Pluses: The 26 page manual that comes with the program is quite clear and takes you step by step through the use of its features. The program is menu driven and simple enough to use that the manual may not be necessary after the first or second time a record is set up. The sort routine is extremely fast and may be used on up to three levels. The program is well error trapped, making use by the beginning computerist easy.

Minuses: There can be a maximum of only ten fields. The fields do not support computations. A record, once set up cannot be reconfigured. These minuses are features usually found in much more expensive programs and are not often available in this price range.

Documentation: The manual is easy to use and understand. It is a tutorial showing how each program function

Skill level required: Beginning level user.

Reviewer: Richard E. DeVore

Product Name: WORDRACE & WORDRACE Accessory

Disk

Equip. req'd: Atari 400/800 w/32K & BASIC

Cartridge

Price:

Manufacturer: Don't Ask Computer Software

2265 Westwood Blvd., Suite B-150

Los Angeles, CA 90064

Description: As the name suggests, this is a word game that tests vocabulary skills. Game players, from one to four, must find the correct definition of a word from six possible choices. The clock is ticking so find the correct answer as quickly as possible. Choose your strategy: guess quickly or take more time to study the definitions. Loose points for incorrect answers or too much hesitation. There are three levels of play for everyone from pre-teens to pundits. The number of words in each round of play is selectable, also. For those more interested in sports or famous historical persons, an extra-cost accessory diskette is available. After booting the system diskette, insert the alternate data diskette and the new game data will load.

Pluses: Challenging and educational. This game would also be a valuable (and fun!) way for a student to prepare for college entrance exams.

Minuses: The graphics are simply boring, but word game lovers will overlook this aspect of the software's design.

Skill level required: Age 9 to adult.

Reviewer: Tim Kilby

Product Name: Preparing For the SAT

Equip. req'd: Atari Computer, Atari 410 Recorder

Price: \$99.95

Manufacturer: Program Design, Inc.

11 Idar Court

Greenwich, CT 06830

Description: Preparing For the SAT is a cassette based series of lessons designed to help prepare for aptitude testing, especially the Scholastic Aptitude Test. The lessons cover analogies, vocabulary, quantitative comparisons, and number relationships. There is one cassette devoted to the taking of aptitude tests with the back side containing a time program for practice. There are a total of six cassettes included with the manuals.

Pluses: Two of the programs have a voice narration included on the cassette for reinforcement. This is a feature used by PDI that I feel greatly enhances the learning process. The information included in the manuals is valid and the programs are well done. After a demonstration, the adults attending spent over an hour working with the various lessons. They not only felt they were learning but found it enjoyable at the same time.

Minuses: Other than the fact that printed tests cannot be made from the programs, I found nothing to complain about.

Documentation: The programs come with two manuals. One is titled "Making The Grade, How To Take and Pass A TEST." This 34 page manual was written by the president of PDI, John Victor. He explains what the tests are, the best methods to use when taking them and shows examples of the types of questions used in the testing. The other 44 page manual explains how to use the programs and has a large section devoted to explaining the problems on the cassettes. They are well done.

Skill level required: High school student or anyone with an inquiring mind.

Reviewer: Richard E. DeVore

MICRO

Let Unique Data Systems help you raise your sights on AIM 65 applications with our versatile family of AIM support products.

Go for high quality with our ACE-100 Enclosure. It accommodates the AIM 65 perfectly, without modification, and features easy access two board add-on space, plus a $3'' \times 5'' \times 17''$ and a 4" × 5" × 15.5" area for power supplies and other components. \$186.00.

Get high capability with Unique Data System's add-on boards. The UDS-100 Series Memory-I/O boards add up to 16K bytes of RAM memory or up to 48K bytes ROM/PROM/EPROM to your Rockwell AIM 65. You also get 20 independently programmable parallel I/O lines with an additional user-dedicated 6522 VIA, two independent RS-232 channels with 16 switch-selectable baud rates (50 to 19.2K baud), and a large on-board prototyping area. Prices start at \$259.00.

If you need to protect against RAM data loss, the UDS-100B of-

frou need to protect against nam data loss, the observed of fers an on-board battery and charger/switchover circuit. \$296.00. Heighten your AIM 65's communications range by adding the UDS-200 Modern board. It features full compatibility with Bell System 103 type moderns and can be plugged directly into a home telephone jack via a permissive mode DAA. No need for a data jack or acoustic coupler. The UDS-200 also has softwareselectable Autoanswer and Autodial capability with dial tone detector. The modern interfaces via the AIM 65 expansion bus, with the on-board UART and baud rate generator eliminating the need for an RS-232 channel. \$278.00

The UDS-300 Wire Wrap board accepts all .300/.600/.900 IC sockets from 8 to 64 pins. Its features include an intermeshed power distribution system and dual 44-pin card edge connectors

for bus and I/O signal connections. \$45.00.

Get high performance with the ACE-100-07 compact 4" × 5" × 1.7" switching power supply, delivering +5V @ 6A, +12V @ 1A, and +24V for the AIM printer. \$118.00.

Installation kits and other related accessories are also available to implement your AIM expansion plans. Custom hardware design, programming, and assembled systems are also available. High quality, high capability, high performance, with high reliability . . . all from Unique Data Systems. Call or write for additional information.

Products for Commodore, Atari, Apple, and others!

THE MONKEY WRENCH II A PROGRAMMERS AID FOR ATARI 800 **NEW AND IMPROVED — 18 COMMANDS** PLUGS INTO RIGHT CARTRIDGE SLOT

If you are a person who likes to monkey around with the ATARI 800, then THE MONKEY WRENCH II is for you! Make your programming tasks easier, less time-consuming and more fun. Why spend extra hours working on a BASIC program when the MONKEY WRENCH can do it for you in seconds. It can also make backup copies of boot type cassette programs. Plugs into the right slot and works with ATARI BASIC cartridge.

The MONKEY WRENCH provides 18 direct mode commands. They are: AUTO LINE NUMBERING — Provides new line numbers when entering BASIC program lines. RENUMBER — Renumbers BASIC's line numbers including internal references. DELETE LINE NUMBERS Removes a range BASIC line numbers.

\$59.95

— Removes a range BASIC line numbers.

VARIABLES — Display all BASIC variables and their current value. Scrolling — Use the START & SELECT keys to display BASIC lines automatically. Scroll up or down BASIC program. FIND STRING — Find every occurrence of a string, XCHANGE STRING — Find every occurrence of a string and replace it with another string. MOVE LINES — Move lines from one part of program to another part of program. COPY LINES — Copy lines from one part of program to another part of program. FORMATTED LIST — Print BASIC program in special line format and automatic page numbering. DISK DIRECTORY — Display Disk Directory. CHANGE MARGINS — Provides the capability to easily change the screen margins. MEMORY TEST — Provides the capability to test RAM memory. CURSOR EXCHANGE — Allows usage of the cursor keys without holding down the CTRL key. UPPER CASE LOCK — Keeps the computer in the upper case character set. HEX CONVERSION — Converts a hexadecimal number to a decimal number. DECIMAL CONVER-VERSION — Converts a hexadecimal number to a decimal number. DECIMAL CONVER-SION — Converts a decimal number to a hexadecimal number. MONITOR — Enter the machine language monitor.

In addition to the BASIC commands, the Monkey Wrench also contains a machine language monitor with 16 commands used to interact with the powerful features of the 6502 microprocessor.

VIC RABBIT CARTRIDGE AND CBM 64 RABBIT CARTRIDGE

"High-Speed Cassette Load and Save!"

\$39.95 (includes Cartridge and Manual)

Expansion Connector on the VIC Cartridge

"Don't waste your Life away waiting to LOAD and SAVE programs on Cassete Deck.

Load or Save 8K in approximately 30 seconds! Try it — your Un-Rabbitized VIC takes almost 3 minutes. It's not only Fast but VERY RELIABLE.

Almost as fast as VIC Disk Drive! Don't be foolish — Why buy the disk when you can get the VIC Rabbit for much, much less!

Now for the "64"

lt's a

Designed

Software

System

Easy to install — it just plugs in. Expansion Connector on rear. Works with or without Expansion Memory. Works with VIC Cassette Deck. 12 Commands provide other neat features.

Also Available for 2001, 4001, and 8032

TELSTAR 64

Sophisticated Terminal Communications Cartridge for the 64. *PFO* IOD OOD CP<D1>D2 BELL 12:30:00 10:14:36 (TELSTAR's Status Line)

Don't settle for less than the best!

- Upload/Download to/from disk or tape.
- Automatic File Translation.
- · Communicates in Industry Standard ASCII.
- Real-Time Clock plus Alarm Clock.
- · Line editing capability allows correcting and resending long command lines
- 9 Quick Read functions.
- Similar to our famous STCP Terminal package.
- . Works with Commodore Moderns and supports auto-dialing.

The best feature is the price - only \$49.95 (Cartridge and Manual)

Machine Language Monitor Cartridue

for the CBM 64

More than 20 commands allow you to access the CBM 64's Microprocessors Registers and Memory Contents. Commands include assemble, disassemble, registers, memory, transfer, compare, plus many more.

Someday every CBM 64 owner will need a monitor such as this.

Cartridge and Manual - \$24.95

More than just an Assembler/Editor!

Professionally Development

PET APPLE **ATARI** \$169.95 Only \$59.95

NOW. The Best for Less!

- Designed to improve Programmer Productivity Similar syntax and commands No need to rele peculiar syntaxes and commands when you go from PET to APPLE to ATARI.
- Coresident Assembler/Editor No need to load the Editor then the Assembler then the Editor, etc.
- Also includes Word Processor, Relocating Loade and much more

 Join the ATUG User Group for MAE formatted
- STILL NOT CONVINCED? Send for free spec sheet!

ATARI, PET, AND CBM 64 **EPROM PROGRAMMER**

Programs 2716 and 2532 EPROMs. Includes hardware and software. PET = \$75.00 - ATARI and CBM 64 (both include sophisticated machine language monitor) = \$119.95

Prowriter Printer - Excellent dot matrix print Parallel = \$489 00 Serial = \$600 00 IEEE = \$589 00

CBM 64 Debugger

A more sophisticated Machine Language Monitor/Debugger. 20K of object code makes this a powerful tool. Works as a symbolic debugger for the MAE assembler. Diskette and Manual — \$49.95

TRAP 65 TRAP 65 is a hardware device that

IHAH 65 is a hardware device that plugs into your 6502's socket. Prevents execution of unimplemented opcodes and provides capability to extend the machines' instruction set. For PET/APPLE/SYM. Reduced from \$149 95 to \$69 95

PUT THE FULL POWER OF YOUR VICE20 AT YOUR COMMAND!

Order your copy of MICRO's newest book...

MASTERING YOUR VIC-20 with eight BASIC projects

Now you can do more with your ViC-20. This new book and the eight projects and programs it contains can teach you how to master VIC BASIC programming. Each chapter concentrates on a particular aspect of VIC BASIC, and each program is accompanied by discovery-oriented, tutorial text.

You'll Receive:

- → MICRO Calc...a miniature spreadsheet program that makes complex, repetitive calculations a breeze.
 - ♦ MASTER...a guessing game that teaches programming with random numbers and flags.
- clear directions that will quickly have you writing programs, modifying them and acking features all on your own.

 And to help you master your VIC-20 even faster, all hight programs in the book are already keyed in on the ags.

 accompanying

♦ VIC Clock...to teach you ON..GOSUB function and character graphics.

◆ BREAK-UP...a popular game that also teaches how animation is achieved with PEEKS and POKES to screen memory.

Use this coupon or the postage paid card in this issue to order.

INICROInterface Clinic

by Ralph Tenny

computer can be interfaced to real time events, but if a computer is to be able to react with and control real time activities, it must know when the events are happening. There are two basic ways to accomplish this — polling and interrupts. An interrupt is a way to signal a running computer — gaining its attention — that it must delay further execution of the running program to service another event. Most modern microprocessors have provision for three kinds of interrupts. The first, called RESET, is used on startup and causes the microprocessor's internal registers to be set to a known condition instead of the random condition which happens when power is first applied. In addition, the internal RESET algorithm initiates certain operations, including reading an external memory location for (usually) the address of the programmer's idea of a proper initialization routine. This is called indirect addressing, which means that the first data read from memory is not an instruction but the address of an instruction.

Two other interrupts are common also. The IRQ (Interrupt ReQuest) is typically a maskable interrupt (meaning it can be turned off via a software flag), and the NMI (Non-Maskable Interrupt) are usually available on modern microprocessors. These interrupts cause some portion of the microprocessor's status to be saved so the interrupted program can be resumed in orderly fashion. Those of you with 6809-based machines also have three software interrupts (similar to the 6502's BRK instruction and the FIRQ (Fast Interrupt ReQuest) which responds more rapidly than IRQ by saving fewer processor registers).

Programming for interrupts requires special precautions and programming methods. Not only do you have to have special *interrupt service* programs, you must carefully manage the interrupt enable bit and the associated hardware which causes the interrupt. It is universal practice that interrupt input pins are at logic one level during normal operation, and respond (issue an interrupt) when the pin is pulled to logic

zero. Usually, the NMI interrupt is edge-sensitive (a negative-going input is latched internally) so that the pin must go high and then come low again before another interrupt is accepted. IRO inputs are usually level-sensitive; if the interrupt service routine is completed before the pin is released, another interrupt will be issued immediately. In one aspect, the microprocessor's response to either IRQ or NMI is identical — the current instruction is completed before the interrupt is honored. In most cases, the microprocessor also ignores further interrupts until the current interrupt service routine is finished. This is accomplished by using the RTI (ReTurn from Interrupt) instruction to terminate the service routine.

The program in the listing illustrates how to handle interrupts caused by the CD input of the serial port. This input drives the CA1 pin of the I/O PIA of the Color Computer, and the IRQ output from the PIA is connected to the 6809's FIRQ pin. The IRQ and the FIRQ interrupts each have their own disable flags. If either bit is set to logic one, the corresponding interrupt is inhibited or turned off. Unlike some processors (6502 for example) which directly set or clear status register bits, the 6809 uses special AND or OR instructions which set or clear selected status bit. One such example is shown in the listing one line above the label SPIN (\$301D) -ANDCC \$BF. If you remember how the logical AND works, any bit in the operand is set to zero if the corresponding mask bit is zero. In this case, the bit mask (pattern) is \$BF, which has all bits except Bit 6 set to logic one. Thus, Bit 6 in the operand (Condition Code register or Status Register) is set to logic zero; this enables (turns on) the FIRQ interrupt. Similarly, at the label QUIT (\$3055) the instruction ORCC \$40 is used to turn off the FIRQ interrupt. Refer to Figure 1, which shows the PIA Control Register and briefly identifies the functions of each Control Register bit. For now, we will skip a complete description of this register's functions; instead, note bits 6 and 7, which are IRQ

flags. CA1 is always an input and can be programmed as an interupt; CA2 can be either an ouput or input/interrupt. Similar relationships are true for Control Register B, CB1 and CB2. If CA1 and CA2 are programed as interrupts, Bit 7 responds when CA1 is pulled low, and Bit 6 responds to CA2. Last month's applications program polled the RS-232IN line (bit 0 of the port), but since our serial adapter also pulses the CD input, we could have polled bit 7 of the Control Register instead.

Let's examine the program flow in the listing. Beginning at the label START, the location BUFR (defined at the program's end) is cleared, then the time constant DVAL is stored in CoCo's baud rate buffer. The next command points the Y INDEX to the next location past BUFR; this can be omitted after program debugging; it simply provides a record of the input values to aid in troubleshooting. The next three instructions read the current value in the PIA Control Register, turn on Bit 0, and restore the modified value. This is the first of three steps required to completely enable the interrupt structure so this PIA can cause a processor interrupt.

The second portion of setting up an

interrupt is to load the vector, which is the address of a routine to service (respond to) a particular interrupt. The 6809 microprocessor has provisions for eight interrupts, seven of which have been implemented and one has been reserved for future expansion. Upon receipt of an interrupt, the 6809 reads one of the eight two-byte values it finds in the memory space \$FFF0 to \$FFFF. When a Synchronous Address Multiplier (SAM) is in the system, as in the Color Computer, SAM forces these interrupts to be moved to \$BFF0-\$BFFF. If you examine memory (use a debug monitor or PEEKs), you will find some two-byte values stored as part of the BASIC ROM. Some of those addresses point to the memory area beginning at \$0100. Remember, the interrupt structure expects these address vectors to be indirect addresses which point to the interrupt service routine. Since these routines can be anywhere, and of any length, a jump table is used. This is a series of absolute jumps, listed one after the other in memory. So, for any of the vectors beginning at \$0100, you will find 7E XX XX, where XX XX represents the starting address of the interrupt service routine. The FIRQ vector is used to auto-start CoCo from a ROMPACK, so BASIC initializes the FIRQ vector at \$010F. If we wish our FIRQ service routine to be used, then we must substitute our vector for the BASIC vector. The three program steps beginning at \$3017 do just that. BASIC has already written the code \$7E (IMP) in location \$010F, so our program reads the address of INTSRV and writes two bytes (\$302A) beginning at \$0110. That is Step 2 needed to initialize an interrupt. Step 3 follows: read the port to clear Bit 7 in case CD has been pulsed while we were talking, and then enable the FIRQ interrupt. This cancels any pending interrupt which came in before we were ready, and allows our routine to begin with a clean slate.

In this particular case, our program simply goes into a wait loop, checking the keyboard to see if we push a key. Anytime an interrupt comes in, the eight bits captured by the serial adapter's input pin come spinning in, just as they did when we polled the RS-232IN line last month. This has been a slightly simplistic explanation, but it is accurate for any CoCo which does not have Extended BASIC. Extended BASIC runs a software timer based on IRQ, and triggered by a 60 Hz interrupt signal on CB1 of the keyboard PIA, but since FIRQ is a higher priority (more important | interrupt, our signal will dominate. Since our

control the CA1 Interrupt input pin (see text).

routine will run longer than the 16.6 millisecond period of the 60 Hz interrupt each time it happens, the BASIC clock will miss a "tick" every so often. If you depend on this clock, you may wish to poll the serial adapter instead of run it under interrupt control.

Once the interrupt happens, the code at label INTSRV begins to execute. Much of this code is identical to the previous programs which we have used to exercise the hardware, so let's concentrate on the differences. Just as we had to manage the interrupt entry software carefully, certain things must be accomplished by the service routine. The processor automatically disables both interrupt bits whenever either IRQ or FIRQ are asserted, and the RTI instruction restores the original interrupt enable status upon exit from the service routine. Obviously, the service routine must perform the intended task which created the need for an interrupt, but it must also *clear* the interrupt (prevent the same interrupt from being asserted again).

If external hardware can be cleared or reset to remove the stimulus, this must be done. If this cannot be done. the service routine must continually check for the hardware status, waiting for it to clear itself. Our hardware automaticaly removes the stimulus, so we have one other thing to clear. Bit 7 of the Control Register was set by the input pulse on the CD input, and will remain set until the port is read (label EXIT). Note that although we read that port, this value is not used. The service routine is finally terminated with RTI, and (in this case) operation in the loop SPIN is resumed. Note that almost any other operation could take the place of this loop, but this is a simple example, so feel free to improvise.

We didn't get to the real world interfaces I promised last time, so we'll try again next time. This has been a learning series, preparing for "greater things", so any of you who have just joined us may have to review earlier columns for background. Let's move on and do more complex and comprehensive interfacing!

MICRO"

LISA v2.6

You don't need an I.Q. of 200 to learn assembly language on your Apple II or AppleIIe. All you need is the best 6502 assembler around: **Lazer's Interactive Symbolic Assembler (LISA v2.6)**. LISA is the easy-to-learn and easy-to-use system that will have even the absolute beginner up and running in a matter of minutes. In addition to LISA's clearly written 240-page manual more tutorial material is available for LISA than any other assembler (including books by D. Fudge, R. Hyde, W. Mauer, and R. Mottola). LISA is trie beginner's best choice.

Even if your I.Q. is 200, you'll appreciate LISA's speed, power, and ease of use. At 20,000 lines/minute it's 20 to 30 times faster than ORCA/M or Apple's own Toolkit assembler. That's why people like Bill Budge, Ken Williams, Brian Fitzgerald. Don Fudge, and Steve Wozniak use it every day. LISA is very usable. That's why it's the most often used assembler ever created for the Apple II.

LISA v2.6 is available for \$79.95 at computer stores everywhere. If your local computer store doesn't have a copy you can order directly from.

The main feature topic for

January is Communications. One of the areas microcomputer usage which is really expanding is that of telecommunication. There are literally hundreds of "bulletin boards", "teleservices", and so forth for you to talk to. MICRO is developing on its own hardware/software system. The MICRO Program Dump, that will allow subscribers to "download" programs that are published in MICRO directly into their microcomputers. The feature article Transfer Programs Over the Telephone will help your micro tie into the MICRO Program Dump. A second feature will be on Local Networks, a form of communication that allows you to interconnect various system components such as microcomputers, printers, storage devices and so forth. A third article will be about Using

the VIC/C64 Parallel Port,

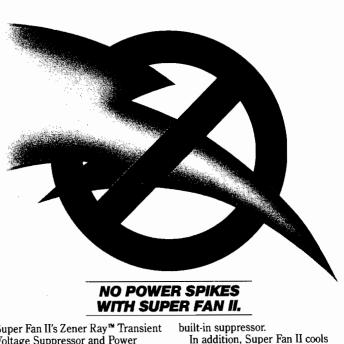

providing cabling informa-

tion and a program for

transfering information via

this useful, but not well sup-

ported, device.

Super Fan II's Zener Ray™ Transient Voltage Suppressor and Power Filter squelches spikes up to 6000 amps - even those caused by lightning-while responding up to 100 times faster than Apple II's

RHELECTRONICS, INC.

AICRO'

This Christmas, Atari and Commodore owners will go out of their minds.

It'll take about 30 seconds.

Because once you boot a Datamost game on your Atari home computer, or your Commodore 64, you'll come face to screen with the most mind-blasting games ever.

And what better time to go out of your mind than Christmas?

Our Music Will Have You Hearing Things. Going out of your mind never sounded so good.

Because now our games have music. You heard right. Music. Original Music. Through-

out. And scored just for our newest releases. You'll go nuts over it.

Our Graphics Will Have You Seeing Things.

You and everybody else.

Because our games are so greathow great are they? – they're so great you'll want to play them again and again and again. And then

your friends will go bonkers over them. And they'll want to play. And then your family will want to play. And then total strangers off the street will want to play and...

Mind-blowing arcade-quality action like this makes it one mad world, pal.

We'll Torment You Right From The Start.

No time to settle down and get comfy.

The tension begins building the moment you boot the game.

Terrific screen titles tease you with the game's objective, scenario, characters.

And while you wait, hand twitching over the Joystick, you'll find out what planet you're on.

What the fuss is all about.

Why you're involved. And perhaps of singular importance to you personally, how to keep from being obliterated. So get ready to get the

most out of your mind.

By getting the most out of ours.

DATAMOST
The most out of our minds.

THE TAIL OF BETA LYRAE.™ Changes as you play. Unpredictable. Impossible to master. (No one has!)

Habit-forming!

COHEN'S TOWERS.™ You're the mailboy in a big city skyscraper. Work your way to the top.

MR. ROBOT.™ Screens scream with color, action and sound! Design your own screens, too.

More speed, more memory workspace from the people who lifted the 64K limit.

In 1981, we introduced our famous Saturn RAM card to boost the Apple's memory by 32K. Now, there are 64K and 128K versions for added power.

Increased RAM lets you run bigger programs, and our VisiCalc® expansion software provides a dramatic expansion of workspace memory. Also, the extra memory can work as a pseudo disk for instant access. (No more 20-second searches!) The Saturn RAM board is a super aid for advanced word processing, data base management, spread sheet, and accounting applications. And perfect with PASCAL, CP/M®, and BASIC.

Use our easily installed cards in combination—and get a whopping 220K of VisiCalc workspace on the Apple IIe. Or sensational enhancements on Apple II, II + , Franklin, Basis and most Apple compatibles. We even have software that increases your Apple's memory in BASIC programming up to 4 megabytes!

This kind of performance requires sophisticated bank switching and supporting software that we originated, proved, and improved. Buy from the leader!

Let us help you expand your Apple's productivity. For information on our RAM boards and other Titan microcomputer products, see your computer dealer or contact: Titan Technologies, Inc., P.O. Box 8050, Ann Arbor, MI 48107; Telephone (313) 973-8422.

AT LAST: THE WHOLE TRUTH ABOUT FLOPPIES.

Amazing book reveals

How to keep from brainwashing your disk so it never loses it's memory

memory.
How fingerprints can actually damage disks.
Unretouched Kirlian photographs of UFO's (Unidentified Floppy Objects)! The incredible importance of making copies: the Department of Redundancy Department—and what goes on when it goes on! Powerful secret methods that scientists claim can actually prevent computer amnesial All this, and much more

In short, it's an 80page plain-English, graphically stunning, pocket-sized definitive guide to the care and feeding of flexible disks.

For The Book, ask your nearest computer store that sells Elephant disks, and bring along one and one half earth dollars.

For the name of the store, ask us.
